Future Development Plan 2023 #1

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

I think this works but should be focused in areas closer to the city.
Intensifying Penrose and New Lynn isn't the answer, people should have options closer to town where lots of people work and have more options for socializing etc

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Local centre's should be improved but I disagree with intensifying housing in far flung suburbs versus closer to the city.

Te Atatu peninsula is being heavily intensified, but all those people use the existing roads.

The intensification should focus on central areas with the access and space for them.
Ignore the Nimbys and build people houses where they want to live

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

There should be heavy focus on reducing the impacts of climate change, not just responds to it.
Stop building roads and carparks

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #27

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Expanding outwards would increase infrastructure costs and maintenance costs and increase strain on current infrastructure

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Any action taken to make it easier for people to get around the city without a car will reduce traffic, air, and noise pollution

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Developing areas that are hazardous would be extremely dangerous for those living and working in those areas.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Not only does it help improve safety and water management but it'll improve the look and feel of the city

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #50

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Future Development Plan 2023 #65

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

There are too many people living in existing urban areas that increase the stress on communities and living environment, which decrease people's life quality. Developing greenfield areas will not only relief stress of exisiting areas but also offers people more choices on different life styles.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

I don't know

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Spreading out will cost more in infrastructure costs when we havent fixed the current infrastructure. Developers oppose it because it causes them to not make as much money as they do now. Climate Change dictates we do not spread out but build up our communities and infrastructure within existing Communities.
I wish to speak before committee.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

We need to fix existing infrastructure.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Planning without continuity has led to a loss of confidence in the government, whichever party should walk the talk. Instead of letting people down like this.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Building residential areas around the city and building more supporting facilities can drive more employment and economic development. This is a trend of urban development. Instead of confining people to a certain area with a narrow vision.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

Shouldn't the government have already assessed the environment before planning a new community? Now that it has been evaluated, why should it be evaluated again? Could it be that the normal procedures were not followed during the evaluation?

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Other

Tell us why

Communities already under construction should be completed. But some green areas can be changed according to the new regulations. I wouldn't mind more greenery in the community.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

A healthy Auckland requires different decisions, but the plan has been made, and a sudden change of plan will make Aucklanders less trustworthy with the government. Please don't change your plans easily.

Future Development Plan 2023 #105

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

I have no confidence in your planning. The drainage and roading infrastructure is blatantly obvious with the recent flooding events and increasing traffic delays around the city.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

intensification makes it harder to get around the city, with more traffic delays. Walking, cycling and public transport is not easier for young families with pushchairs, bikes etc. The city is not safe for young girls to get home on public transport, I still need to pick up in a car. I am time poor,

and do not have time to catch a bus/train to escort her home. This does not work for many families.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Further development is required with URGENCY in affected areas. The way this question is written sounds like this will take too long. Peoples lives have been affected by poor infrastructure planning. Get on with the improvements. Don't intensify in these areas until the infrastructure is fixed.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

I don't know

Tell us why

will it work and cope with the ongoing weather events. How long will this take? Need more information on efficacy of this type of solution and length of time to implement.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

My ratings of Auckland council services in the last 12 months:

Train infrastructure, many delays and cancellations = 1/10

Drainage in Remuera, have experienced multiple floods = 1/10

Response from councillors to fix infrastructure (Healthy water officers site visits to property to assess compliance against outdated guidelines = 1/10

Delays getting around the city due to road works 1/10

Decisions to planting deciduous trees in areas prone to flooding with very little clearance of drains = stupid

Future Development Plan 2023 #121

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Planning needs to be changed to remove the existing subsidies so that the full costs are bought to bear to promote efficient outcomes.

Costs are hardly taken into consideration at this time.

a) Developments must pay the full cost of their development through targeted rates (i.e. user pays). This will drive down the viability of greenfields development.

b) a) should be for all costs except transport where road users must pay the full costs, not house purchasers as they are not necessarily car users. This will require working with central government to ensure fuel excise tax, road user charges or direct road pricing are in place to collect the costs.

c) Auckland needs to work with central government to ensure NPS and NES's are put in place to cover key environmental effects, e.g. sunlight and shading, wind, smell, vision zero safe access but without density limitations. The NPSs/NESs would limit the density that a single site can achieve and site amalgamation would be favoured for dense developments with the corresponding good environmental outcomes.

d) If c) is effectively implemented then the need for zoning diminishes substantially. Zoning is a massive distortion with regulatory rules (which dont undergo individual cost benefit assessment) badly distorting outcomes, e.g. car dependent mono zoned low density residential development.

By removing/reducing zoning constraints mixed use is much more likely to develop. Such development is much more like historic walkable cities where the ground floor is commercial with residential above. This supports VKT & emissions outcomes.

e) Auckland must work with central government to reduce and remove vehicle user subsidies. This will lead to better urban outcomes, better climate change outcomes and significant mode shift.

i) no congestion tolls

ii) ratepayer subsidy - road users should pay full costs

iii) crown subsidy - road users should pay

iv) full priced parking - no free parking or time restrictions

v) vehicle air pollution levy

vi) vision zero designed road system (implies lower speeds and relative mode shift)

vi) there are other subsidies as well but the main ones are above.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

Future Development Plan 2023 #166

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Intensifying in the urban areas will not help in providing affordable rent or housing. More houses in already expensive areas will still be expensive due to the location, unless the government can intervene and control housing and rental prices

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Not everyone works at local centres...what we need is better and more accessible public transport that is reliable

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

Removing entire areas out of FUZ is discriminating one area over another. You are depriving the area of potential development/regeneration/improvement to the area. Which could have bought in new employment opportunities, improve communities and help distribute people/wealth around

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Yes there needs to be more focus on green infrastructure and utilising ways to manage the affects of climate change, more rain gardens!

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

The council shouldn’t be so drastic in removing entire areas, I would strongly recommend the council to relook ay the strategy and back with more research in the areas

Future Development Plan 2023 #194

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

I agree that this should be the goal, however it will only work if public transport, and cycling pathways and other transport/ accesibilty factors are addressed. Otherwise you will create a dense city without the benefits, just congestion

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

If those access ways are improved this will work

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #196

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

It will spoil many leafy streets

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

We should not be building in areas that flood or my slip

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

15 minute cities are the way of the future. It's appalling that Auckland Council has enabled developers to destroy the food producing region around pukekohe and decades of urban sprawl without transport, healthcare or green space infrastructure will take time to unwind. Please, please plan for shared green space, waste water treatment that protects ocean, local access to healthy food and public transport to service high density areas.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Commuting for hours is so unhealthy and uneconomical. It destroys the environment as well. I don't think you need a consultation to make this happen, I think you need to get started on the work.....

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

"Looked at" is too soft. First, stop approving any new development in risk zones, second provide a low, medium and high risk zoning label to all of existing property within a year. Anyone in high risk areas could be incentivised to move. Again, less consultation, more tangible action

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

This should be done alongside fixing existing storm water systems and stopping waste water run off into the Hauraki gulf.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Please accelerate public transport links.

Look how popular the northern express bus lane is. This was not a difficult concept or build. Why on earth there is not a western, eastern and Southern bus lane down the motorway is beyond me. Straight forward, achievable, could be delivered in tandem in 5 years and turned into light rail in the future. Secondly, why not turn dairy flat airport into an ePlane hub for short haul flights?

Finally, Wayne Brown is a disgrace. I was appalled with Auckland Councils gross negligence during the Anniversary floods. It was obvious to anyone that travel networks should have been closed during the day to prevent loss of life and mitigate property damage. New Zealanders need to start taking accountability for responding proactively rather than waiting for government guidance however basic Leadership and corporate /

Disaster communications were completely absent from Auckland Council. Please do the basics right in the future.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Other

Tell us why

Auckland city has become extremely over populated already. People are forced to live in "little compact boxes".

I am 53 years of age. I am maori. I was born and raised in central Auckland, Mount Eden.

Personally I am very saddened to watch Auckland being "abused and used" for financial gain, money and investments. 70% of our beautiful country is owned by wealthy foreigners. Maori only own 3% of New Zealand land. A lot of this land was stolen from maori by the commenwealth countries.

Auckland is NOT "Auckland" any more. There are so many immigrants, especially Asians. I find them rude, and taking advantage of our beautiful country while they make money. White collar crime is higher than ever. A lot of dishonesty.

Money is not worth having, if our government, councils, politicians etc put "economy and tourism, sales of our new Zealand land to foreigners... FIRST.
You have taken the soul out of our country. This is not my home anymore.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

We kiwi's are already stressed with the amount of foreign people. Don't waste "our" money on more apartment buildings for Asians. Stop the overcrowding of immigrants in our central cities and paying for transportation etc, for THEIR convenience.

Our beautiful country is already so ruined. Example:... People are dying unnecessarily on our "transportation network". Trucks being driven by immigrants that don't know our roads are killing kiwi's every day now. Our roads are in such a dangerous condition and the government will never be able to repair the damage as it will only get worse. Climate change is going to be so severe within the next year.
We kiwi's are dying unnecessarily S.O.S. !!

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

Stop the overcrowding.
Refer to my previous answer above.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

Im afraid many, myself included, are not impressed with what you have done with the inner city. Yes it will be beautiful and scenic and easier to walk in, the DAY. But at NIGHT, walking in the city is dangerous and removing where cars can pick and drop off, puts people at risk of getting attacked/harassed when on their way home. This is without even mentioning the inconvenience it places on emergency services when trying to navigate the city. No one uses the wider areas of the sidewalks, pedestrians and escooters alike. There are not enough people who bike to work to justify the remodeling. Maybe to reduce carbon emissions, bus routes can be improved and made consistent. No one (besides street racers and emergency services) willing drive around the city. Most only pick up and drop off, which they can no longer do. I am disappointed in the decision makers of these works as they have clearly not resided in the city to understand its dynamics.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

Disagree

Tell us why

The world's foremost authority on climate change the UN's IPCC finds not trends in floods, droughts, increased storms or cyclones globally. Stop wasting tax payers time and money on CO2 emissions other than providing Auckland with an integrated Metro.

"...low confidence regarding the sign of trend in the magnitude and/or frequency of floods on a global scale."

IPCC. AR5 WGI Section 2.6.2.2

"...low confidence in a global-scale observed trend in drought or dryness (lack of rainfall) since the middle of the 20th century..."

IPCC. AR5 WGI Section 2.6.2.3

"...low confidence in trends in small-scale severe weather phenomena such as hail and thunderstorms..."

IPCC. AR5 WGI Section 2.6.2.4

"...confidence in large scale changes in the intensity of extreme extratropical cyclones [storms] since 1900 is low."
IPCC. AR5 WGI Section 2.6.4

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

The percentage of the atmosphere that comprises CO2 is just 0.043%

Of that, humans have contributed around one third, or 0.013%

Or a hundred thirtieths of one percent.

Totally insignificant as a driver of climate.

CO2 has been 17 times higher in geological earth's history.

New Zealand contributes just 0.17% to global CO2 emissions.

Any reductions made in the West will be dwarfed for the next one hundred years as more of China, India, Africa, many part of South America and South East Asia industrialise.

Stop wasting tax payers time and money on negligent CO2 emissions. Which in any case NASA has demonstrated is fertilising plants around the world:

https://www.nasa.gov/feature/goddard/2016/carbon-dioxide-fertilization-greening-earth

My only hope is that a change of government will change Auckland Councils near obsessive psychosis on CO2 and climate.

Territorial ($MtCO_2$)

Rank	Country	$MtCO_2$
1	China	10668
	United States of America	4713
	India	2442
	Russian Federation	1577
	Germany	644
	New Zealand	34

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Developing on brownfields is obvious first choice, however, I don't believe impacting a dense city without the proper infrastructure (like what has happened in the past) is appropriate. Population growth will continue to increase in Auckland over then next 30 years, therefore, Auckland as a region should continue to grow and develop as required (within the boundaries of the region).

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

I don't know

Tell us why

I don't disagree with the statement, my concern as a citizen, is that these areas will be carbon taxed if you choose to leave them. Basically imprisoning citizens within their 15 minute city. So as positive as the statement is above, I don't believe the intention will be positive in the long term.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Agreed, areas susceptible to floods and hazards should be enivornmentally reviewed and an Enivornmental Impact Report generated and accessible to the public.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Not feasible for a city of over 5M. Absolutely provide sustainable options, but rain gardens are not going to solve city wide infrastructure issues. People are struggling to get to work on the train because they aren't reliable, city infrastructure is not planned properly, we build the structures and then go back and upgrade the utilities. This to me will be a waste of tax dollars.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Auckland is a city where access to nature is close and at many's doorstep. I believe what Auckland Council is proposing is the ability to tick some boxes to show how green and sustainable they are without thinking through the long term affects and costs that are being proposed.

Future Development Plan 2023 #727

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Other

Tell us why

Nobody is talking about the real problem – population growth. Whether you grow outwards or inwards, it still means having to deal with more traffic, more sewerage, more demands on water and electricity supplies, more waste / pollution and consumption.
Auckland should NOT be catering for more growth. NZ should be discouraging less population growth as this is the reason we have environmental problems.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

I'm going to say what everyone else is too afraid to. Drop the Maori kowtowing where things have nothing to do with Maori. Maori had no concept of cities or dozens of other things which now end up with PC Maori labels. It's patronising to Maori, alienating to non-Maori, confusing to visitors, and divisive to the whole of the country (please note that pre-European Maori didn't even have a concept of a country, let alone referred to one as "Aotearoa"). Personally I find it offensive, as do many people (both European and Maori) I encounter.

Agree

Tell us why

Why would we want to put more people in danger of flooding and cost us even more money

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Makes sense to do this and will help with drainage hopefully

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Can't wait to see what the CRL is like .

We need more people working productively see so many people sitting about on their phones meant to be on infrastructure jobs but wasting time

Future Development Plan 2023 #792

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

It seems logical to me not to speak Auckland wider.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Less emphasis on cars for transport and more emphasis on walking and biking.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Allthough we need buildings and industry close by we also need to keep our green fields and productive growing areas. It seems crazy to build over bush, fields and orchards etc. We need these areas for people, animals and take up of green house gases.
Once it is gone you cannot get it back. Look at overseas for that concrete environment,

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

I don't know

Tell us why

While we need more housing etc it seems silly to put people in buildings built quickly (and for a profit for developers) and with less robust materials. Perhaps build up. Not 4 properties on the side of where one house was. I have noticed most have not green area of their own to sit down, allow children to play. Perhaps building up and tunring some areas into parks etc for people to enjoy. I remember in the 1970's and 1980's developers had to leave green areas which got used by families.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

I would imagine many people in Auckland live in front prone areas. It is a hilly city. There are many streams that need to be checked by council regululary to clear debris. Building in areas that flood is not a good idea. Either stop bank and keep looking after them or not build.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

As long as it is looked after consistently by the council.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Too many houses build on a section that had 1-2 houses and lawn. It is now all driveways and concrete very quick run off. time to be absorbed by the ground. Slow the rush to build the terrace or town house type of house. Also make sure other properties are not shaded by these new buildings going up.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Your go to market explanation needs to define URBAN and CITY EDGES as currently it is vague and ambiguous. Without this information a response is impossible. Urban = city. Based on this you are ignoring areas suburban where many choose to live and many don't need to live/work near/in the city. Favouring one over the other is biased and unfair way of spending taxes / rates paid by those you intend to disadvantage.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Community connection or resilience is not based on proximity to services nor cities.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

I think if an area is already a potential hazard, based on sound findings, it would be unwise to further develop,

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #1202

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

You have gone to the wrong area of Auckland Drury which is market gardening for Auckland. Already you are encroaching on good market gardening lands.

The correct area you should be concentrating on is Silverdale where there is a likely increase of 80,000 people in the Silverdale Orewa Whangaparoa area. For this reason I have put forward a proposal to Waka Kotahi that we urgently need a new bridge now not in 6 years time. This bridge will be able to have a rail transport, 3 lanes each way of traffic and a walking/cycling link on the eastern side. This link is vital because the foundation for HEAVY RAIL is already laid out in the busway on the North Shore and this link should be extended from Albany right through alongside the present mortorway right to Silverdale. This would now give all these people which is now city sized a fast trip to town on modern rail engines that would be much faster than the crawl these people have now to get to the city centre. It will also cut down the number of cars and buses coming into the city so reducing the carbon emmisions a great deal. The bridge design I put forward to Waka Kotahi is the cheapest and fastest way to get rail to the North Shore. It was designed by Engineers both local and International American, Chinese and top Kiwi engineers. We do not need a tunnel under the harbour as proposed by Waka Kotahi because underwater tunnels need pumping 24 hours a day seven days a week 365 days a year so are very expensive to maintain. A bridge is much cheaper to build. I am a reseacher not an Engineer but I have worked throughout with Engineers for 25 years and more. The oveseas Engineers cannot understand why it has taken us so long to start thinking about another crossing. No matter what, Waka Kotahi

should not allow a walking crossing to be attached to the present bridge. Definitely unsafe to do so. The clip-ons on the bridge are past their time and need replacing. Waka Kotahi stated they would put 350 tons of steel into the clip-ons to strengthen them. When they started they realized then it was far worse then they contemplated and had to put over 900 tons of steel to strengthen them. The same design clip-ons were crossing the Mississippi river in America and acxross a harbour in Tasmania. both these clip-ons fell into the water and we were lucky it never happened here.
There is plenty of land available in the Silverdale area for developing. This is where you could make a huge difference.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

It is easier to service & maintain infrastructure in a smaller environment. Green space should be maintained for quality of life.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Other

Tell us why

All of the infrastructure should be inplace before residential building begins. Private transport ie cars needs to be included in planning.8

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

The council should not be buying out private housing in risk areas. It should investigate & prevent developments in risk areas.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Nature based infrastructure should be included along side other methods.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

The council needs to proitise essential services before entertainment services.

Future Development Plan 2023 #1238

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

I disagree because its left up to private developers putting in a hodge podge. There is no money for infrastructure and people cant afford it. Some people may like to live in little boxes and have little box lives, but thats not why I stay in new zealand. I stay here because I dont have to live a work, netflix, sleep lifestyle.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

I agree that the car is not the answer to transportation problems. But I dont see much else, we cant even get a bike or pedestrian across the harbour bridge ffs. Hopeless.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

I agree with addressing climate change. I dont agree with "climate injustice". We are all going to fucking die. I hate complainers that want to let everyone else bail the boat out.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

I think this approach seems to work, blue carbon is an added advantage of wetlands.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #1244

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Straggling growth into the rural areas around Auckland City is uneconomic and inefficient. It also threatens good productive agricultural and horticultural land thereby lessening the amount of food that is grown near to this dense population centre. In turn this means more food miles to transport fresh vegetables fruit etc. into the Auckland market place and may even mean more importation of food from overseas, which would mean a huge increase in food miles, and would be bad for our part in CO2 emissions.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Clearly this strategy would reduce the amount of CO2 emissions that are produced when people have to travel long distances to work, shops, schools, etc.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

It would be foolish to do otherwise! Plans already in the pipeline for areas known to be at risk from climate changes should be stopped , dropped and turned around. Private developers should not be given any leeway either. Maps should be drawn up of all flood plain and prone areas, coastal areas that need protection or entire removal of human activities. These maps should then clearly show where future development is simply not allowed. In addition where existing developments must be either totally removed or significantly protected for the future events due to climate change.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Absolutely agree with this plan for future nature based infrastructure...see above answer.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

It is important to take into account future demographics, especially as the 'baby-boomers' die out. More housing will be available as the entire population numbers decline. However, if more people are encouraged to live and work in Auckland these problems will continue. If New Zealand and Auckland in particular, is sure that the total population will increase, has anyone thought of creating a 'New Town', such as has been done in the UK?

This idea gives the existing city of Auckland a firm boundary within which changes can be made for the better. A 'Green Belt' of productive and recreational land can surround it without the fear of the constant, ugly, urban creep that we have seen over the last 10-20 years, that is destroying the character of the smaller villages and towns in the region.

A 'New Town' could be built with its own new infrastructure, industrial areas, schools, houses, clinics, big parks, recreational areas, and its own transport within its boundaries. A Green Belt could surround it, perhaps some of the parks could be within it. The constant stress of more people and more infrastructure needed in Auckland would no longer exist.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

I live in Browns Bay it is a shambles here, So many large ugly buildings taking over small sections. One size does not fit all. Our infrastructure is too old to deal with the growth that is happening here

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

We would dearly love to park and ride with buses but there is little or no parking unless you are there before the workers.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Just common sense

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Sounds very pleasant and anything to restore the natural environment

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Don’t get bogged down with only one plan. There must be room to have a variety of developments and are not all slam bam in one area. A bit of spread in appropriate places and a little high rise again in appropriate areas. Maybe intensive development where the infrastructure is not so old. These large 3-4 buildings to a previous 1 house section is beyond awful. Small “village” type developments, with social hubs.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Helps to make a real community spirit BUT Auckland needs much better infrastructure and understand that good design is an essential components . The Council should be more careful on giving building concents . Allowing a parking building on the waterfront is shocking.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

It makes for better community feeling as in Europe , less driving waiting times but the design of the areas is very poor in Auckland and buildings and public gardeners need much better

designers. The new urban architecture of Lyon France could be a perfect model for Auckland instead of the cheap looking and boring work of someNZ architects.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

The devastation , huge waste of money and people's misery is horrendous as shown by cyclone Gabriel and this should be a priority to deal with. Just make sure these solutions are aesthetically pleasing instead of full of unslightly weeds as is the sad case in the Wynyard Quarter.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Sensible plan but these could be attractive places instead of all the ugly buildings and poorly designed townhouses going up.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Sack the councillors who are useless, tunnel visioned, against Mayor Browns desperate attempts to rectify the woes and and decisions of the past. Also the landscape designers are hopeless and the state of their dreary gardens are appalling with almost no maintenance or vision.

Future Development Plan 2023 #1514

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

While there are some huge sections which can have more housing on I'm very sad to see where one house used to sit there is now 3, 4, or even 5 homes squashed in with no room for children to play or just be. Some have no car parks at all so the roads are packed hampering movement and many seem to be built without families in mind with little or no storage space. Just very basic small living areas. These would maybe work as a retirement property but instead work like a hotbed with no room to breathe and very little communal space or parks.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Where possible this makes sense

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

It makes sense that if an area becomes a known hazard these are minimised as much as possible

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

This approach helps with natural hazards effects in a better way

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Generally the whole stormwater system worked as planned / designed. Maybe you need to understand your own understructure design and explain to the public that public drainage is only designed for a 1 in 20 event. No city stormwater system in the world can cope with a 1 in 100 year event. None of this crap would make any difference other than add more to building costs.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #1632

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

The rural margins surrounding Auckland will be needed for providing food and to mitigate the environmental effects of urban living. It should be easier and more cost effective to upgrade the city's infrastructure than to expand it into the countryside.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

In ways similar to the above the more infrastructure has to spread the less cost effective the upgrades will be. Transporting humans and the services they require will be more expensive and environmentally damaging the further they have to move.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

The long-term cost of making environmentally hazardous areas safe for humans to inhabit will be disproportionatly high when compared with the befefit of making the conversion.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Other

Tell us why

Whilst I agree with the need to enhance nature-based solutions I do not agree that development should be decentralised. Enhancing nature and natural solutions should not be used as ways to restrict centralisation.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

We should be planning to withdraw from environmentally hazardous areas within the current city boundaries, buying out the inhabitants at market rates when and where appropriate, with a view toconcentrating the population around hubs and along communication routes. Twenty and thirty story buildings with a mix of residential, commercial and retail use should become commonplace. A retail centre on the 10th to 12th floor of a building should be sustainable providing access is quick and easy - including aerial walkways between buildings.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

We need denser cities but i disagree with the current strategies. We need bigger, denser town centres, not 3 story buildings nest to single level building. And stop pretending allowing houses to be built without parking will meant they wont have a car. just pushes them on to the streets. And I'd love it if the council went and checked on big developments more. One in glenfield sold off the required second driveway (on to glenfield road) after it was signed off and built a house on it.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

Tell us why

Adapting to our environment is how we combat weather events. THe CO2 scam should be exposed for what it is.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Use unproductive land to increase housing, larger sections soak up a lot of rain. Dense coronation street, future slums cause excess water to be dumped into the stormwater system. Look at using monsoon drains in appropriate areas for weather events where we get large rainfalls over a short time.

Future Development Plan 2023 #1964

Tell us why

You are ruining the character of the suburbs by allowing for large intensive townhouse developments to be built right up next to single dwelling properties. They are filling the streets with cars, as they dont even need to provide off street parking. You cant buy a house without worrying about what monstrosity is going to be built next door, overlooking you. Its a terrible idea. You need to build out further, but provide good transport. Build the roads out to new town centres.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

you are ruining these small shopping precincts by removing parking not helping them. There are so many examples of shopping areas where you now cant park due to bloody cycleways taking up the road.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
Its the only sensible approach to climate change.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

I don't know

Tell us why
I dont know what Mauri-Enhancing is.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Fix the roads. you have made traffic so bad by prioritising pedestrians, buses and cyclists that you are literally choking the city. Stop stuffing up intersections with pedestrian prioritisations, stop building cycleways and blocking lanes for buses. You need to start thinking about how people actually live and start to prioritise cars again. I really dont understand why you dont do this already.

Future Development Plan 2023 #1979

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

The housing is mostly governmental with very little emphasis on the private sector

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

You have successfully blocked peoples access to their normal travel routes by installing stupid speed bumps so that people will opt for travel on the very few clear roadways to get to their destinations, thereby making the process for each individual a prolonged and fraught journey. It may ease the motorway congestion and save you having to spend any money there [not that

you've spent much there in the last 20 years anyway], but there were other measures you could have chosen.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

If you tell the globalists to stop their cloud seeding to bring in weather events from any and all directions, you won't have any climate change, just normalization

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

I don't know

Tell us why

I cannot comment on this as I have not seen any proposals, however I would ad that every new bid should include private rain- water catchments ie; smaller Manacon tanks that will bring in rain water from roof tops. This will prevent restrictions during periods of drought.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Yes stop all the government handouts to the new immigrants. There should only be a minimialistic period of time, ie; 18months for a family or person to arrive, get themselves set up and begin to earn their own way. That way we will at least put a cap to borrowing.

Future Development Plan 2023 #2003

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Prioritizing some projects will necessarily stop some projects, does priority depend on which projects are canceled? Could not agree.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Auckland's long-term development should be diverse and optional. rather than limiting and non-optional.

Future Development Plan 2023 #2179

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

I don't know

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

In europe the appartment blocks are at least 6 stories but people are out and about walking, biking and more

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

The local centres become a hub or mixing, eating a meal or just having a coffee

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

We should not be putting people at risk whether they are the builders or later the residents

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Urban sprawl is the most inefficient and environmentally harmful way of developing any city. A denser city will make a lot of things, like access to amenities and commuting to work or school, easier. Also giving up agricultural land to build more housing for a growing city seems very short sighted. People (and cities) shouldn't have to choose between housing and food.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Longer commute times are known to reduce productivity and wellbeing, so reduced commuting times are good. Also considering that the majority of trips are made by a car in Auckland, it'll be

good for both environment and congestion too. Removing urban parking lots and street parking should also help with mode shift.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

Areas with known significant hazards should be banned for development.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

Future Development Plan 2023 #2281

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

There is already too much crowded housing in urban areas. Housing in urban areas should have green spaces - not stacked right beside each other with no privacy. There is plenty of greenfield areas at Auckland's edges for spread out housing growth, while still retaining our regional parks throughout all of Auckland.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Just because housing is located near services doesn't necessary make it easier i.e., there is an unsheltered bus stop at the end of my driveway, however in order to take a bus to my work to

arrive on time, it would mean I would have to get up an hour earlier than usual to meet their timetable, take two separate buses to get to work and take 40-50 minutes to get to work, rather than use my car and take just 17 minutes to get to work - where there is free car parking. There is also a New World supermarket close to me, but their is limited parking (even with my mobility permit) so I travel to a supermarket and shops further away, where there is easier access and more parking available and a nicer environment.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

If there are areas with known natural hazard risks, there shouldn't be any developments there at all i.e., an investigation (which would cost money) shouldn't even be approach - it's a straight NO - leave these areas for tree planting and green spaces and also reduce developments with concrete blocks/pads and replace with grass or other material that allows for drainage.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

It's logical and makes sense!

Other feedback

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Greenfield expansion should be halted much sooner

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

The priority should be to build a vibrant, densely populated inner city.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

People should only be able to build in high risk zones if they sign a waiver that they don't expect the rate payer to pay for their remediation, adaptation or managed retreat costs down the track.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Agree. But this should not only be a means to adaptation. It should also help bring access to closer connection to nature, and support native biodiversity.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Yes, I think you should remove (or bury underground) the terrible noisy overpasses that have destroyed the livability of the inner city. And I think you should go ahead with the walking and cycling only bridge - whatever people say. This would become an incredible destination - to be able to walk out over the water, without car noise. It would be very special, and well worth the investment.

Future Development Plan 2023 #2480

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

I think train is underused because it's neither cost nor time-saving. Also the reason for multiple buses stopping at station at the same time is beyond my comprehension. Often the first bus is filled n the 2nd or 3rd are empty. And they all goes to the same destination. I think bus should loop around it's neighborhood only and ends at train station to encourage people to use the train to get in-between suburbs n city centre. This will reduce underused bus lane , encourage train use, reduce carbon emissions and road congestion for sure. It is better to improve the subway and train system than running more buses on road. Subway and train should be fast. Think Sydney , Singapore, Tokyo subway systems, they are fast and affordable. Also state highway 16 could be improved. The great north road exit currently feeds into Avondale, new Lynn, kelston, glen Eden, gledene and titirangi, resulting in massive congestion getting in and out of the motorway due to the high population around in this area. Ideally a motorway should be run in-between these suburbs.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

We need to protect farm land. Also, sprawl complicates transport options and discourages active transport.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

The use of cars should be discouraged for short trips. Protected paths will encourage more active transport modes (walking & cycling)

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Houses should not be built in flood zones or where there are other hazards like slips.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

There are too many high density, lightless and ugly boxes being built throughout Auckland. This is a very unhealthy way of living, with no gardens and sun and far too much dense traffic. It's no use telling people to use public transport - it is far too slow and badly connected and children can't be just sent off alone. Try being a parent and having to take two children to different schools and then get to work. Impossible by public transport.

Bicycles simply aren't realistic or safe in most hilly areas and in Auckland weather.

I grew up in a flat north German town where cycling was better provided for and children could get to school on their own, but it was still dangerous and difficult in winter.

You are absolutely deluding yourselves if you think huge, hilly Auckland with strong weather patterns can do something that was barely feasible in a small, flat German town.
Forcing people into high density, lightless boxes is not the answer. Small satellite towns with houses and gardens and as much independent small business as possible are the lifestyle most people want.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

High density, small, lightless boxes without gardens are not the answer. We are seeing them shoved into previously nice areas throughout Auckland.
Small satellite towns with houses and gardens and plenty of parks in between, with as much independent small business as possible are the lifestyle most people want.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

You are basing your assumptions on incorrect science. It has been admitted that global warming is much lower that was fear mongered. In previous decades the threats in Europe used to be another ice age, then acid rain, then nuclear war etc. Non of it was true, so why should we believe you now?

Because of false methane data millions of livestock are being culled. False assumptions about CO2 causing global warming are destroying our economy for virtue signalling, as we can't make the slightest dent in world co2 emissions overall and lower co2 emissions would not lower global temperatures anyway because co2 follows higher temperatures rather than causing them.

About natural disasters: Esk valley flooding was mainly the fault of logging. Auckland flooding was due to your overpopulation in your high density lightless boxes.

As for crumbling Auckland cliffs: yes, steep cliffs tend to crumble over time, so sensible building restrictions should be set.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

The disgusting high density, lightless boxes you want us to live in have no gardens. They produce far too much sewage for the infrastructure.

And your assumptions about climate change are based on false data such as the incorrect claims against methane and co2.

Your plans are dividing people as much as possible from nature. They won't have gardens, be able to grow some food or enjoy some sun. You are completely destroying Auckland with your high density policies.
Small satellite towns with houses and gardens and plenty of parks in between, with as much independent small business as possible are the lifestyle most people want.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Stop following the globalist lies about climate change and supposed benefits of forcing people into high density lightless boxes. Return Auckland to less dense development with small satellite towns with houses and gardens and plenty of parks in between, with as much independent small business as possible. Discourage the government from high immigration policies. The whole benefit of living in New Zealand is a relaxed lifestyle with gardens, parks and beaches. So stop crowding more people in to make this impossible.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Infrastructure need to be resilient and capable to handle aucklands needs for 40 years in the future. Too often our projects are too small and don't handle aucklands population growth when they are completed. This is often because the extremely slow construction

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Build Bigger and faster. Capable for for auckland to handle a population of 3 million plus. Climate is going to cause issues golbally which will continue to make auckland a great home, and could see even more immagration. We need massive improvements to infrastructure, a denser with better public transport central suburbs. (Interior Motorway loop centre) Then high car traffic movement and better family oriented regional highstreet areas in outer suburbs. The urban sprawl means the car is the best option. To help climate focus on them not stuck in traffic. Make public transport work in a denser central city.

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #2832

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

We need wise use of land, why destroy arable and fantastic growing land for apartment blocks which absolutely no one likes.
I have seen orchards and vineyards, profitable farms and growers of fruit and vegetables driven out because of urban sprawl

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Drive along the motorways when people are going to and from work! There are as many people travelling north and a similar lot driving out to work!

People are leaving for work at 5.30am to avoid congestion. Travelling to work by public transport was hailed a big success however it is totally unreliable you need elec.buses as well as trains because you never know if what gettin* the train means these days! Cancellations incident shut downs etc. 2 hours travel on 2-3 seperate conductors morning and night is not unusual!

When buses were removed and trains hailed as increasingly popular options were removed. Auckland is spread out over what was 5 cities (which worked better for residents) you will never get people out of cars because there's no reliable options.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

They should never have been allowed to build there, common sense. Greed driven.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

It has been done in Christchurch and overseas very successfully.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

There's very little option for people on the outer suburbs. I have grandchildren travelling on several

Means of transport to get to work.

And an adult who finds travel home South takes 2 hours after 4pm and at 8-9am to work. When there's no option 4 hours daily driving in heavy traffic with the huge amount of large trucks on the roads and motorways to a job is stressful.

Recently I had a Ute push into traffic just before lights and from a cycle lane clipping my car and causing damage which meant I had excess to pay they were uninsured. That was at 3-4pm in extremely heavy traffic. At Takanini where the traffic was frighteningly heavy and drivers impatient.

The number of traffic accidents between 3-6pm and 7-9 must be horrendous.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

We live in a city that needs to expand and despite wanting to have nature based infrastructure this often isnt practical or the best option to achieve good outcomes. Focus on improving the public transport system to reduce climate change rather than cumbersome rain gardens etc that are expensive and difficult to maintain. Install infrastructure that works and can cope with the expansion required not the product that makes you look good but doesnt do the job long term.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Our local areas are dying for improvements, especially around infrastructure and transport. Look at how the floods have destroyed livelihoods in the blink of an eye and this will keep happening as climate change continues to get worse. Everyone I know in Auckland are so angry at how our quality of life has disintegrated over the last 5 or so years.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

So important to have local areas where you can do your living. Being stuck in traffic or having to travel far to access necessities or even just for social things is not accessible for everyone.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Environmental hazards are something we cannot control. So how we become resilient to prepare and take action is important.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #3125

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Endless Greenfield sprawl is non sustainable ecologically, logistically or financially. We should aspire to create cities that are designed for people, not cars.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Intensification needs to be focused around areas that can provide amenity for its residents within a walkable distance.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Intensification of housing in more appropriate areas will allow for naturally hazardous sites to remain or become undeveloped and serve as stormwater mitigation reserves and ecological oases.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

We don't need to waste funding on complex stormwater infrastructure when wetlands do a better job.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

We should greatly restrict low density greenfield development. New developments should be required to provide space allocations and infrastructure for train/bus lines and segregated cycleways.

We need make Auckland a city where cycling and walking is the go-to mode of transportation for short trips. High density areas should have no on-street parking allocation (only drop-off areas for service vehicles), and must have end of trip facilities for cycling, and a convenient public transport connection.

Existing road lanes should be converted into bus lanes for popular lines.

This approach is consistent with the values of Te Ao Maori, will greatly reduce our transportation associated c02 emissions, and will create a more liveable city.

It is time for a fundamental shift in the way Auckland functions. We need to catch up to what the Netherlands did in the 1970s.

Future Development Plan 2023 #3189

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

The central areas are already too densely populated. With rent prices too high, it is already an unaccessible place for many people that cannot afford to live centrally. There is always a lack of parking, always a lack of transport and it is crowded. Putting more development in already existing areas is doing nothing to decrease that burden. Supermarkets are already packed and this proposal is just seeking to add to the burden. The infrastructure is just not good enough to sustain a more crowded area. This proposal is making it more difficult for people who are unable to afford to live in that area. There is already a lot of people who live on the outskirts of auckland having to commute in, the development of that land should be first and foremost rather than developing and making an already developed area more densely populated. This does nothing to help the actual wellbeing of people in Auckland and causes more stress and financial worries. Efforts should rather be made on improving the public transport and developing the outskirts of Auckland so that people have places to live comfortable and not be crowded in.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

It is unclear how the council is proposing to develop already crowded areas. The council has said that it helps to develop areas with access to local amenities - but the local amenities are already at capacity. If you go to a supermarket, it is absolutely packed and so are gyms. It is unclear why the council consider that packing people in more densely would be beneficial. Most people are requiring a place to live so that they can commute to and fro from work, and a lot of work is in different areas of auckland. This plan only accounts for people accessing local amenities but the reality is that people will be on public transport and commuting to and fro from work. It is much better to develop areas on the outskirts so that people can comfortably access local amenities and also have a place to live comfortably and within their financial means than develop an already over-populated area.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

This is not very conducive to growing New Zealand and is unclear why this wasn't looked into prior to zoning being done. A lot of people have purchased land or sold land on the premise of future urban development, if there is flooding, then the council should look to increase infrastructure in that area. It also makes it hard for people already living in that area - and seems like the council is leaving them to fend for themselves to seek an easier solution.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Agree if this can be done in a timely manner.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

The council's ever changing proposals are creating an unstable environment for residents. The economy of NZ is already being challenged, to keep going back on the council's proposed plans, rather than finding a way to address concerns (e.g. around flooding in proposed areas) is decreasing the reliability of council in investors' views and is also burdening the residents who live there - investors are unlikely to continue to invest in New Zealand's future when there is so much change and uncertainty and the council goes back on its word often. The council's role is to provide for the people and improve the quality of life. At the moment, this is not being achieved and will not be achieved with the proposed solution. To more densely populate an already populated area is not a pragmatic solution - Auckland is already too densely populated, you fight for parking space - you line up for a long time at your local supermarket just to pay, the local gym is always full. Everything has a long wait time already, by increasing the density in these local areas, it is putting more of a burden on people who already find it difficult. In fact, i'm sure it would result in more people living out rural or moving overseas if the council's proposed new development were to happen. It also raises concern in how this was initially decided if contingencies were not accounted for. It appears that these proposed amendments are yet again concerning and wasting further resources and funding that could be better utilised in addressing the now known problems and sticking to the original plan.

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Auckland is moving into good food production areas which should be used to feed the growing population. Also it will make transport easier in a closer area.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Helps with transport, work and ease of living.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
Building on flood prone areas should never had been allowed without flood control prevention measures being in place.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why
Sensible.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Although Auckland will need more housing to accomodate the large population growth expected, it makes no economic sense extending the land area covered by it.

Higher density development within existing infrastructure is better. These established frameworks will need upgrading anyway as they age but at least they will not be duplicated.

There are a large number of areas in the inner city begging for upgrade and renewal at much higher densities BUT it is CRITICAL to have world class urban design not hotchpotch random development.

These areas are already serviced with facilities more easily upgraded.
Higher density developments should be allowed along established transport lines.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Smaller commuting times or distances for work, education shopping provide more time for recreation.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We understand that the council have to be seen to be doing the right thing by asking ratepayers for our say however, we all know that the council have their own agenda and our say doesn't count. This has been proven by online threads and talking to people. Added to that, everyone is fed up with the increasing high rates annually through council wasting ratepayers money. If ratepayers money had been spent wisely the council would not be in the predicament that it currently is. Many disgruntled Aucklanders and unhappy with where Auckland is now and it's future.

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #3365

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why
traffic jam

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

I want a city where I can also drive my car when I need. That I can go from suburb to city center in less than 1 hour.

Yes, by all means make it for friendly for walking and cycling, but not at the cost of preventing people from using their cars, this is just as important.

And while you're at it, make sure public transport is actually there, with more options that don't take more than going by car, maybe you'll be able to get close to what it is in Europe, where all Modes of transportation have a place and work sinergistically.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

Don’t forget that we as people deserve better. We are so focus on emissions and halving everything in 10 years that this is all coming at the cost of our livelihoods and right to move. If we are not doing all of this to improve people’s lives, why do it?

So far, the so called improvements just made auckanders lives harder.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Other

Tell us why

In rural areas, rich fertile flat land should not be built on, neither should flood planes or areas of outstanding beauty. In urban areas every bit of green should be maintained for public use, as tiny compact dwellings need nearby space to enjoy, socialize and exercise on. So if building happens in rural areas it should be on poor spoil, unusable land for anything else, e.g.the hilly parts of Coatesville.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Other

Tell us why

I only go shopping once a week and manage everything else on the same occasion, eg shopping, library, doctor, visiting friends. Working from home, especially on a four day week has to be catered for. City centers will have to change to suit the times rather than push people back into outdated work habits.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

Why weren't you doing this before! Local production of food such as salads could be carried out in areas prone to noise ie near airports, and in flood planes. Industrial sites should only be in large locations served by public transports and main roads and railways.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

It's the only way to go.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Auckland"s population is growing more rapidly than the Council can cope with. Unless the worker has a job offer in Auckland they should go to other parts of New Zealand to live, and only have the option of moving into Auckland if they become a New Zealand resident or citizen, or are vital to the work force of Auckland.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #3525

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

The Unitary Plan, when released. set excellent guidance with high rises near transport hubs and reducing in scale the further away. The governments proposal to allow 3 level buildings everywhere must be stopped as it is ruining communities.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

The zoning boundaries need more consideration and site visits before defining. The Unitary Plan goals were good but some of the boundaries between zones were silly. (eg; a zone change from 3

level to 2 level dwellings, made between 2 properties rather than to the north of 20m width of 3 driveways that would have given a good buffer)

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

The rules enable such assessment. The Planners simply need to ensure they engage with and understand the advise by the councils regulatory engineers and the Regulatory Department needs a culture shift to ensure the best outcomes rather than a numbers focus

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

The council needs to ensure it's regulatory department's, Regulatory Engineers, continue to provide the stormwater engineering assessments in to Resource consents. The 3 waters entities are already pushing for concrete pipes to be the first choice solution.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Te Atatu Peninsula has not been updated with any infrastructure & is already not coping

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Supermarket in Te Atatu is abysmal so need to travel out of Te Atatu for a decent supermarket but travelling in & out of Te Atatu is a real mission

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

Since intense new housing development in Te Atatu Peninsula there has been no infrastructure improvement. I have lived here for over 20 years & my property has flooded 3 times this year since 3 apartment blocks have been built opposite me. This has never happened before

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

I think you are all talk & no action. It is all about collecting more rates & to hell with the adverse it has on residence

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Te Atatu Peninsula is one road in & one road out & is getting over populated with no improved infrastructure & the bus service is a joke

Future Development Plan 2023 #3592

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

The current urban growth areas have become excessively intensified, negatively impacting the living standards and environment for residents. Intensifying further developments in these areas will only restrict the economic potential and future of Auckland. Additionally, it is important to note that Auckland does not suffer from a shortage of land available for development.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Other

Tell us why

The concept of the existing future urban plan in Auckland is centered around the idea of distributing developments and establishing additional local centers across the city. This approach

ensures that growth and equal opportunities are not concentrated in one area but are spread out more evenly throughout Auckland. By creating new local centers, the plan promotes accessibility, convenience, and vibrant community spaces for residents in different parts of the city. This approach fosters balanced and sustainable development while enhancing the overall livability and functionality of Auckland as a whole.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

It is necessary to reassess the inclusion of further growth areas (Greenfield) that are exposed to significant environmental hazards, rather than simply avoiding and negating them. These Greenfield areas are already experiencing development and evolving into suburban regions due to the surrounding growth. While the concept of focusing development near local centers is important, it is equally crucial to promptly address the challenges posed by natural hazards in these areas. Immediate action is required to develop the infrastructure and upgrade it to ensure the safety and resilience of the local community.

By reassessing the suitability of these Greenfield areas, we can take into account the potential risks posed by environmental hazards. This allows for more informed decision-making and the implementation of measures to mitigate these risks. It is essential to prioritize the development of robust infrastructure that can withstand and adapt to the challenges presented by natural hazards.

Addressing these challenges requires prompt action to develop the necessary infrastructure in these areas. By upgrading the infrastructure, implementing appropriate safety measures, and ensuring resilience, we can protect the well-being of the local community. This includes considerations such as drainage systems, flood protection, and other relevant precautions to minimize the impact of environmental hazards.

While focusing on development near local centers is an important aspect of urban planning, it should not overlook the need to address the challenges posed by natural hazards in surrounding areas. A comprehensive approach that includes both careful selection of development sites and

the proactive development of infrastructure is necessary to ensure the safety and resilience of the entire community.
In conclusion, instead of avoiding and negating further growth areas exposed to environmental hazards, it is crucial to reassess their inclusion and take prompt action to address the challenges they present. By developing the necessary infrastructure and upgrading it to ensure safety and resilience, we can create sustainable communities that are better prepared to handle environmental hazards.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Other

Tell us why
Prioritizing nature-based infrastructure is ideal for climate change adaptation, it is crucial to consider the hidden costs and long-term maintenance requirements. By conducting comprehensive cost-benefit assessments and exploring innovative financing mechanisms, decision-makers can ensure the viability and sustainability of these projects. By doing so, we can harness the benefits of nature-based solutions while effectively managing their ongoing maintenance needs.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

It is important to maintain consistency and stability in the future urban planning strategy for Auckland. The existing strategy has been in place for years, providing a framework that Aucklanders and developers have become familiar with and have based their plans and investments on. Abruptly changing this strategy without sufficient notice can create uncertainty and erode confidence in the council's decision-making process for future developments.

By sticking to the established plan, the council can ensure continuity in Auckland's development trajectory. This allows developers to proceed with their projects with confidence, knowing that the agreed-upon guidelines and regulations will remain in place. Consistency in the planning strategy provides a sense of reliability and stability for all stakeholders involved.

Changing the future urban plan strategy in a short period of time can lead to confusion and delays in ongoing projects. Developers may have to revisit their plans, and this could potentially impact timelines and budgets. Such changes may also deter future investment and development, as the credibility and trust in the council's decisions may be called into question.

To maintain a positive environment for development and investment, it is crucial for the council to honor its commitments and uphold the current future urban plan strategy. This fosters a sense of predictability and reliability, instilling confidence in the decision-making process and ensuring that Auckland's development can proceed smoothly.

In summary, maintaining the existing future urban plan strategy is vital for preserving continuity, instilling confidence in the council's decision-making process, and fostering a stable environment for Auckland's development. By honoring the commitments and adhering to the established strategy, the council can demonstrate its reliability and create a positive climate for ongoing and future development projects.

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Auckland has already sprawled, and has a very low urban density. Low density, single-family homes with no mixed zoning is bad for the economy, individuals and communities. We need to protect the high quality agricultural and ecological sites around Auckland, and instead focus on increasing density within the city. Improve land-management, remove free parking for cars and replace it with efficient residential, bike/bus lanes.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

This is good. Please remove car-centric infrastructure around these areas however, as they pose many health and social damages to communities and make places less pleasant to spend time and do business in. Car-free days or pedestrianised areas with safe, comfortable, interesting and reliable public/active transport options to these areas would make these centres much more attractive.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
that's a no brainer, honestly!

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why
Yes please! Can you also make it possible/encourage people to plant alternatives to low grass on their verges? Native grasses, other low-maintenance/height plants increase biodiversity and soils ability to drain water. Please remove on-street free parking to help reduce the amount of concrete on our streets. Look at Japan's street design (all parking has to be paid for, off-street or on private property) for inspiration please.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

More bike lanes rolled out, much faster. Please implement them as an experiment, then get feedback after 3-6 months and make amends. Please remove parking in bus-lanes at all times. Please ban parking on-street anywhere where bikes might be travelling close to traffic. Streets and roads are for transport, and communities. They are public spaces, NOT for the storage of private property.

Disagree

Tell us why

Again your TOP OF THE LIST is Climate Change - for 1000's of years the climate has changed - but today including some of the backdown from the IPCC themselves (not reported or acknowledged by the Greens) the zero carbon evidence for NZ IS NOT TRUE.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

You currently already have - land re zoning taking place - The past /current Government need to back off their ego trips and resign. There is enough stuff already happening , and some suggested projected not started, Keep Central Gov out of the picture and start listening to the people in the local areas, then bring in the 'wisdom' needed to forward plan sensibly, economically, practically. Might seem strange to you but if you do it sensibly and (as listed) the environment will fall into place.

As does H & S.

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #3698

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why
this will stop Auckland's future development.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why
Auckland shall grow bigger and higher, but not too dense and compact.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

I don't know

Tell us why

Climate change is a global issue, could not be controlled by local residents.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

- The existing infrastructure is insufficient to meet the level of development proposed and so most of the theoretical capacity won't happen unless prices rise further (and so can support the necessary infrastructure cost upgrades).

- The baseline value set by existing housing in much of the existing urban area means that it is very difficult to deliver affordable homes. The policy rhetoric isn't evidence based in this regard. Housing in places like Drury is fundamentally more affordable.

- being at a distance from the CBD doesn't fundamentally increase transport emissions. Many people work in other places like the industrial areas from Wiri to Drury and so living in the south is a more suitable alternative. The recent transition to flexible working for white collar workers also places less emphasis on the cbd (which many Aucklanders never go to) and yet all of the policy is about greater accessibility to the cbd. We should be encouraging business to locate in a variety of locations if we want to reduce emissions.

- any constraint on land supply is contrary to affordable housing objectives. Rather than limit supply just put the responsibility for new infrastructure on developers. That will depress the value of future urban land but it won't restrict development and drive up prices.

- the housing supply numbers are completely distorted. The green fields supply is all practical ie can be delivered. The brownfields numbers are theoretical - most of it won't eventuate because

the land won't become available for development for decades by virtue of existing houses. The comparison made is manipulated to support the proposal.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

This is where people actually live and function. There should be more focus on this and less on proximity to the cbd. I grew up in highland park and we never went to the city and nor did my parents for work. Most of my friends parents didn't either. The obsession with density in the suburbs close to the cbd where infrastructure is worst, flooding is a problem and house prices are high doesn't solve anything for anyone

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Common sense

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Which ironically is much easier to achieve in green fields areas. See earlier comments. By contrasting doing this in brownfields location where development will occur a few units at a time is extremely difficult.

Disagree

Tell us why

Does dense cities like Hong Kong and Tokyo make environment better and improve well-being's? Just go there and interview people living there first and then give your recommendations. Dense cities only create more pollution, less secured neighborhoods and less happies. Urban area will be way too crowded, much more traffic jam and no parking space. More houses, more people, more cars. But road is the same, which means more parking on the street, less space for traffic. More people, nosier neighborhoods, less comfortable living environments. Besides, what about the people living in the rural area if less investment allocated there? Is it fair?

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

If you can’t built a public transport system with loads of buses and metro lines like UK and Tokyo, there is no way people will use public transport. The only train in Auckland is always delayed, out of service, or not running for various reason. With this standard and poor Auckland council, no way you can achieve the target you said above.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Disagree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #3735

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

Resilient infrastructure

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

While promoting growth within existing urban areas may yield economic benefits, it is crucial to evaluate the long-term consequences. Restricting growth primarily to established urban zones

might lead to increased property prices due to limited supply, potentially exacerbating housing affordability challenges for Auckland residents. Moreover, a lack of opportunities for new

The approach of emphasizing the concentration of housing and business developments near local centers carries the potential to inadvertently elevate stress levels among the general public and

strain the existing infrastructure.

It is particularly crucial to consider the future development of the city, taking into account the anticipated population growth and the diverse requirements of various communities

Such a concentrated development strategy may lead to compromised privacy and heightened susceptibility to health-related issues. As a consequence, residents' overall quality of life may be

adversely affected. It is therefore imperative to acknowledge that placing a higher priority on existing urban areas poses the risk of compounding these challenges while neglecting to adequately

address the essential needs for sustainable and livable environments.

Given the concerns outlined above, it is more appropriate to adopt a comprehensive and diversified approach to development. Instead of confining growth solely to brownfield areas, it is more

appropriate to consider the utilization of other suitable areas, such as the Future Urban Zones that have already been identified and announced. This approach will help to alleviate the strain

on brownfields and effectively mitigate the negative impacts associated with concentrated growth.

This will also assist to distribute economical growth across multiple areas which can ease traffic congestion in particular area/s, enhance transportation connectivity, and foster the creation of

vibrant, mixed-use communities.

commercial developments in greenfield areas could hinder business expansion, innovation, and the diversification of industries. A balanced approach that considers both urban and greenfield

growth areas (i.e. Future Urban Zones that have already been identified) can create a healthier economic ecosystem for the city.

I strongly disagree with council's intention to remove existing identified Future Urban Areas (i.e. Takanini area) and restrict the construction of new homes solely to brownfield areas within existing

suburbs. While I understand the need for housing development and the utilization of brownfield sites, I believe this decision overlooks several critical factors that may have

long-term negative consequences for the city of Auckland. The removal of areas that have already been classified as Future Urban Zones (i.e. The Takanini area), disregarding the substantial

planning and consultation that have already been invested over the years, which would be seen as an unwise and illogical move considering wastage of valuable resources, including both financial

investments and amount of work and resources invested in extensive efforts that have already been made by the council and the publics over the past few years.

This would not only undermine the credibility of the council's decision-making process but also represent a significant setback in the overall development of the city.

The proximity of the existing identified Future Urban Areas (i.e. Takanini area) to the urban core should also not be disregarded.

Locations like Takanini, which are close to major transport routes (i.e. Motorway) and arterial roads (i.e. Great South Road), hold significant potential for development and growth.

Removing these areas from future plans would neglect their strategic importance and hinder the overall progress of Auckland's urban expansion. Restricting development to brownfield areas would

also necessitate substantial infrastructure upgrades, such as resizing sewer lines, to accommodate the increased population density.

These additional costs would burden the council financially, not to mention the intense traffic issues that will occur throughout the constructions of the upgrading process.

Furthermore, confining new housing construction solely to brownfield areas may inadvertently lead to increased costs and subsequently push up house prices. Developers would be compelled to pay

more for land in these limited brownfield areas, leading to higher housing costs for prospective buyers.
This could create further affordability challenges, hindering the ability of individuals and families to find suitable housing within their means.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Other

Tell us why

The approach of emphasizing the concentration of housing and business developments near local centers carries the potential to inadvertently elevate stress levels among the general public and

strain the existing infrastructure.

It is particularly crucial to consider the future development of the city, taking into account the anticipated population growth and the diverse requirements of various communities

Such a concentrated development strategy may lead to compromised privacy and heightened susceptibility to health-related issues. As a consequence, residents' overall quality of life may be

adversely affected. It is therefore imperative to acknowledge that placing a higher priority on existing urban areas poses the risk of compounding these challenges while neglecting to adequately

on brownfields and effectively mitigate the negative impacts associated with concentrated growth.

This will also assist to distribute economical growth across multiple areas which can ease traffic congestion in particular area/s, enhance transportation connectivity, and foster the creation of vibrant, mixed-use communities.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

Rather than avoiding or removal of (indicative) proposed Future Urban Zone area/s (i.e. Takanini area) as mentioned in the Auckland Future Development Strategy 2023-2053 document,I

believe it is more crucial and appropriate to adopt a resilient planning approach instead. By incorporating innovative design strategies, integrating engineering solutions and nature-based

interventions, we can create development plans that minimize exposure to risks and enhance the resilience of communities. This approach ensures that future growth can occur in

greenfield while managing and mitigating potential hazards effectively.

An excellent example is the Hobsonville Point development of a greenfield development that has demonstrated exceptional coping mechanisms during recent rain events, distinguishing it from

many existing brownfield areas that will struggle with future intensification. The Hobsonville Point development stands as a remarkable example of successful urban planning and design that

prioritizes resilience in the face of changing climatic conditions. By embracing the principles and strategies employed at Hobsonville Point, we can create resilient communities capable of

withstanding future challenges and fostering sustainable growth in the existing identified Future Urban Zones (i.e. Takanini areas) instead of avoid or removing them, which will be very illogical

and irrational.

Restricting development in the already identified Future Urban Zone areas (i.e. Takanini area) could also have significant socioeconomic consequences.

These including reduced housing options, limited economic opportunities, and potential displacement of communities.

In light of these aspects, a more balanced and equitable approach is needed, considering the needs of the population and finding ways to mitigate risks through integration innovative

engineering solutions and nature-based interventions while supporting sustainable growth by utilizing the areas that have already been identified as Future Urban Zones

Not to mention this will significantly affect and undermining the credibility of council's decision-making process to everyone. It will also incur a huge lost and waste to the

resources of time, money and works that have been spent in identifying the Future Urban Zones that have already been announced over the past few years.

In light of these aspects, a more balanced and equitable approach is needed, considering the needs of the population and finding ways to mitigate risks through integration innovative engineering solutions and nature-based interventions while supporting sustainable growth by utilizing the areas that have already been identified as Future Urban Zones

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Other

Tell us why

While nature-based interventions offer great potential in addressing a wide range of challenges, it is paramount to integrate well designed engineering solutions

at the same time in achieving successful outcomes. In addition to each of their individual merits, the synergy between innovative design strategies,

engineering solutions, and nature-based interventions can lead to transformational outcomes. The incorporation of these three factors can help us to create sustainable, resilient, and environmentally harmonious projects that benefit both present and future generations.

These interventions not only provide ecological benefits but also offer social and economic advantages.

In light of these points, we should take a more comprehensive approach that combines risk assessment, adaptive planning, socioeconomic considerations, and long-term adaptation strategies. Such as resilient building codes, implementing early warning systems, promoting community education and awareness, and integrating innovative engineering solutions and natural infrastructure for hazard mitigation. By adopting these approaches, we can achieve a balance between population growth and hazard management, ensuring the well-being of communities while safeguarding against environmental risks.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

• Capacity limitations of brownfield areas and potential chaos from multiple major infrastructure works must be considered.

• Restricting all future growth to brownfield areas would worsen traffic congestion issues.

• Concentrated development in brownfield areas could overwhelm road networks and disrupt daily commuting.

• Focusing solely on brownfield areas for growth would exacerbate existing housing challenges.

• Limited land availability and increased demand would intensify housing scarcity and affordability issues.

• A comprehensive approach that considers diverse housing solutions and explores opportunities beyond brownfield areas is necessary. (i.e. the Future Urban Zones)

• Balanced and strategic growth distribution throughout the city is crucial for sustainable urban development.

• A balanced and strategic approach to city growth is needed for improved transportation systems, equitable housing access, and overall liveability

In light of these concerns, I strongly urge the council to reconsider its intention to remove existing identified Future Urban Areas (i.e. Takanini areas) and restrict housing construction solely to

brownfield areas within existing suburbs. I believe a more balanced and inclusive approach, which takes into account the works that have already been done, on how to utilise location of

already identified potential development areas (existing Future Urban Zones, i.e. Takanini areas) for housing developments would be more beneficial for the city of Auckland as a whole.

Future Development Plan 2023 #3834

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Dense housing has proven to major strain on the drainage and other services. It is also not good for peoples mental health to be forced to live in chicken coops. Having no parking is a hazard to the area and fodder for the break ins.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

It not hapenning and peoples work places are not that close to where they live often. Lack of parking and access to shops and supermarkets will get worse .

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

No proof of it happening . If it was a priority it would hvae been addressed before the problems began

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Believe it when I see it. Housing is too intense which negates everything being said.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

More people will leave Auckland due to its detierioration.

Future Development Plan 2023 #3868

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

The distinction of an urban vs a rural area, is totally arbitrary in a city like Auckland. Outside of public reserves, private land should be treated equally and on its merits - in relation to infrastructure, existing community, local job & commercial opportunities, distance to CBD, probability of flooding etc. - to determine where the most beneficial areas are for development. To keep using what was defined "urban" many decades ago, is just laziness by the council.
Let's go back to first principals, spend time on defining a few parameters, and use those to determine what should be "urban" or "rural".

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why
Again, you're making assumptions no based on any hard evidence or stats. Based on your logic, we should keep redeveloping the same centres over and over again for the next 30 years? What about all the wonderful new communities that has been built up over the last 30 years? I know most people would much rather live in say a newly developed community like Silverdale than say an old hub like Otahuhu.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
This is obvious and sound logic - based on REAL evidence (ie. areas which are assessed to be vulnerable)

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

I don't know

Tell us why
Please give some EVIDENCE. Don't just say it's "better" - why is it better / by how much / what's the cost benefit.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #3898

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

1) A more dense city results in improvements to people's wellbeing?! Bold statement? Foolhardy. If you stack people on top on one another without the infrastructure to make their lives easier, you are simply adding rats to the run. And if you ignore the needs and desires of incumbents, you will negatively impact their lives and well-being. 2) Auckland's urban areas are not well connected. Has anyone at Auckland Council recently tried to traverse the city on public transport without having to go all the way into the centre and all the way back out the other side, spending hours longer than it would take in a car? And with cuts to transport, are unlikely to better connected anytime soon.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why
Not everyone wants their local centres to be busier, or to share their neighbourhoods with more people, or more businesses. Some want the calm street in which their children can play and from where they can choose to join the fray as & when.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
But it's probably already too late. As I move around central Auckland, I see scores of new 3-story developments, all built on full concrete pads, the vast majority of which feature not such much as a stand-alone planter pot let alone any green or open 'sponge' areas. Even areas not currently classified as 'prone to significant risk' are proving at risk as the January floods demonstrated.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why
We can't, and won't, do better than nature-based solutions, no matter how clever we think we are being. To wit: biologically-inspired adaptive network design & the Tokyo subway research.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

I don't believe that enough is being done to retain heritage buildings, maintain the feel of neighbourhoods current residents bought into, or protect the light, privacy and capital value of the homes in areas zoned for intensification.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Spreading into greenfield areas is just an easy option and will diminish the issue of building more intensified suburbs and communities. Council should take its stand on the benefits of intensification rather than spending money on greenfields for the benefit of the developers.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Local businesses need more people and intensified communities in a given suburb. We need vibrancy, not ghost suburbs, under utilised library facilities, and community halls etc. We need

strong communities and growing populations in any suburbs and not spreading population on quarter-acres of land per household

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
While addressing intensification, it is timely to address hazards and flooding areas.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why
Stonefield is a good example. We need to give way to parks and basin catching the rain and have a more balanced development in intensification programs.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Some of the historical protection (low levels) should be considered and allow for development and don't hold back and honor the new legislation passed with bipartisan support. The legislation supports intensification within suburbs and simplifies the process.

Future Development Plan 2023 #3921

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

high density has huge impacts on the psychological well being of inhabitants. We have already seen much ugly "hard architecture" spring up with no regard to its sociological impacts.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Not all local communities have room for this. I suppose - for example - you could ruin the green space beside the Remuera library by building shops on it, if you had no other primary objective

than commercial expansion to "serve local needs". One size never fits all; Auckland suburbs have vastly different needs, history, and ethos. Sometimes the primary need is to conserve what has taken many decades to evolve.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

For a long time, Auckland Council knew that the clay cliffs at Hobson Bay were increadingly unstable. The council had expert advice on this years ago. Yet the same council ignored that advice in its fullhardy plan to enable a huge memorial there on an unstable cliff (which has since collapsed). Other agendas seem to underly the foolish unnotified resource consent decision. The council refused to listen to feedback regarding that, so I have low confidence that whatever people say on this survey will have any serious consideration.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Other

Tell us why

I'd have more confidence if basic infrastructure maintenance and repair was the top priority.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Auckland isn't one coherent city. Its a very diverse city. Millions were wasted on Queen St alterations with little public benefit, except to the UK "designer" who brags about his magnificent "transformation" here from distant shores. Auckland people are far more concerned about dirty, damaged footpaths, blocked drains, old sewers and sewage pollution running into Hobson Bay. There's a lot of anger about what matters to the council and what doesn't.

Future Development Plan 2023 #4103

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

We support your proposal that that " most housing and business growth will be focused within existing urban areas". This is important to enable areas of countryside be retained for food production, conservation and recreation including access to the coast. Regional parks can play an important part in all of these already being one of the largest farming operations in the region. At present many parks are only accessible by private transport and not available to many of the region's population.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Other

Tell us why

Agree people should “have easy access to workplaces, services, facilities and shops, communities to become more resilient and connected. It also helps to reduce travel time, emissions, and lower household transport costs.” However greater emphasis is needed to enable easy access to public green spaces i.e. small parks within sight of where people live and neighbourhood parks less than one km from where people live.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

Agree with your statements e.g. that “..known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate”. More decisive action is needed to constrain and stop development in such areas after robust public consultation. Such areas should be returned to nature or agriculture or food production and this is where parks can play a role.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

We agree that... “Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.” We need infrastructure such as “rain gardens, swales, and detention basins” These water and flood retention areas, proposed by Council, can become green parks. However such areas will need a new economic financial system for aquisition. Maintenance will also be large to enable a anthropocenic "novel biodiversity" to develop. This will take many decades. On the other hand private sector horticulture and agriculture could help. What ever way it will demand fundamental opertional change such developing a large supervising ranger service working with the community.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

The Friends of Regional Parks believe regional parks need to be an important part of the regions infrastructure to meet the nature based solutions within the future development of Auckland. We cannot geo-engineer ourselves out of all the human demands on the land water and sea. We need simple solutions to live with nature.

Discussion needed on more visionary futures such as:

1/ The OpenSpace, Sport and Recreation Policy Review being worked on by staff needs to be speeded up and put out for public discussion.

2/ Far more ability for community volunteers to work on their local structures, environment and parks with more professional guidance from a larger ranger service based on international standards.

3/ Have more visionary plans such as the 3/30/300/3000 proposal. See attached

4/Speed up the implementation of teh Regional Park Managemtn Plan in a way it supports and is compatible with the Future Development Strategy

3 -30 -300 -3000 rule for a Parks Revolution

4 simple rules or guidelines for the health, well being and environment for a growing city. Ratios may vary but it's important a principle is adopted and followed.

1 Every citizen should be able to see at least 3 trees (of a decent size) from their home. b]

2 Every citizen lives in a neighbourhood where there is a tree canopy of 30 percent. b]

3 Every citizen has easily access within 300 metres of the nearest park or green space. b]

4 Every citizen using public transport can easily access a large area of countryside or large natural type open space within 3000 seconds of their home. a]

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Existing area are already too dense and exceeds the maximum capacity of existing transport infrastructures. Greenland as an example, it will only cause more issues with congestion and more accidents.
It is also unfair to those who living in urban fringe to miss out on development opportunities

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Unfair to those living at urban fringe

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why

Should be the opposite by investing in these areas to be more resilient.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

I don't know

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #4173

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Other

Tell us why

Agree but you need to invest in those existing areas as well. So far you have not and we are already feeling the safety issues from Street parking and congestion out west due to lack of any decent transport alternatives. Buses and trains often infrequent, lack operating hours and lack coverage to destinations people want to take buses to such as the west coast beaches.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Other

Tell us why

Agree but we need to get serious about Reallocation existing road space at scale so that cycling and PT can actually start to work for people.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Cycling and PT are completely shocking in our city. It's no wonder so many drive. You need to reallocate existing road space at scale all at once so that other modes can be taken seriously and then everyone wins from less congestion and more choice. Plus costs next to nothing to do!

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

We need increased density in the central suburbs. The current restrictions on development in these areas is inequitable and unsustainable. These central suburbs have the best public transport and micro mobility access, therefore it is a no brainer to allow more development in these areas, rather than kms away with motorway access only..

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

Tell us why

The key feedback I have always had is the crucial need for passenger rail to return from Auckland city to Helensville. The electric trains purchased more than 10 years ago didn't fit through the Waitākere tunnel so the line stops at Swanson. In that time at least 50,000 more houses have been constructed so likely 200,000 more cars on the Russ. We live in Waimauku and car pool leaving at 5.30am and it is now bumper to bumper before we get to the NW motorway - it is driving people insane with no work life balance spending more than 3 hours commuting, not to mention the carbon emissions from more homes therefore more cars with no public transport options or improvements.

I've now accepted a promotion to Sydney and will be saving 3 hours per day commute.

Accessible local centres

Just letting you know that I believe that Auckland needs to work through its budget to get things done properly for the money to be there for the things that work together for all concerned. Keep working at it and try not to get into too much debt and remove the debt where possible. Just like a household budget needs to be kept within its means.

I was invited to comment on Council's Future Development Strategy, but the link provided below will not open.

Whilst I do not know what the content of the Strategy is, I would like to make a submission on what I consider should be included in this Strategy.

I consider that the primary location for the future economic and population growth of Auckland should be along the Northern Motor/transport corridor between Albany and Silverdale. My reasons are as follows

- This area does not contain any high quality soils that may be suitable for future agricultural activities.
- It is already fragmented by rural residential/rural living development which is inefficient, a waste of potentially prime urban land, and at these densities it is not viable to provide urban services (in particular reticulated services) to these properties.
- The urban development zoned should extend out either side of the Northern Motorway, one of Auckland's major transport corridors
- It would allow an early designation to be put in place for a two way bus lane to be provided between Albany and Silverdale whilst the land is still zoned rural/undeveloped. In any event

Auckland Council is being very short sighted if it has not already considered the need to set aside land for a public transport corridor and associated car parking between Albany and Silverdale

- The land is the only large track of land available for urban development which so close to Auckland Central and other major regional facilities and services

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. **What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?**

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Wai-o-Taiki Nature Reserve was opened by Sir Peter Scott founder of the World Wildlife Fund in c1979.

During the year one can see 57 different varieties of birds in the area. A mix of seabirds, waders and forest birds.

What is the current state of the Wai-o-Taiki Nature Reserve?

SHUT. CLOSED TO THE PUBLIC.

Why? Erosion. The successful seawall was started but never finished.

Work stopped midterm and even rocks meant for the wall were left in the sand!

Subsequently the path through the reserve fell into the sea!

Both Council and the Local Board have done nothing!

Aucklanders are prevented from experiencing a greater abundance of nature closer to the city than in other nature reserve.

With a proposed increase in housing for 20,000 people in the area, the opening of the Reserve by completing the wall and creating the path will give the new locals, visitors and current residents a gem to be cherished for life.

The intention for the Founder of the World Wildlife Fund will be achieved.

So "Futuredevelopmentstrategy" before starting something new, please complete the wall and reinstall the path responsibly.

Photos

Spoonbills in tree in closed Reserve beyond my garden in Silverton Avenue.

Rocks left in sand when wall work stopped.

.

State of the path. Your appalled staff member and her equally appalled contractor in photo.

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Tell us why

Yes Auckland is growing but I think we don't look far enough ahead and in that we waste a lot of money on project. 1 because I live out west my thought's go to the western highway 16 lovely piece of work but since it has been finish each off ramp Ta atau and Lincoln has been a real muck up from lack of planning. Each off ramp has been changed numerous times and how a bus change over terminal at Lincoln road is going to be another add to the list in two years it will be to small and I can see the Auckland Council is trying to reduce the number of cars on the roads witch is needed but you are doing the same as Rail making it a balls up not think far enough ahead like the harbor bridge sixty years is good till now with no were to go to increase the amount of car etc movments. All this can be fixed if planning can be fixed by the governments make it work so that if the governments change that program can go on and not be stopped by the new government that is for all of NZ. All so Auckland is becoming a place of little houses on the hill side all made of ticky tacky

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Tell us why

Resilient infrastructure

Obtuse ^ shaped solar panel shelters over the motorway that would create energy when it's a sunny day and collect rain on rainy days which would be transported to a filtering facility to turn into drinkable water as a reserve during the summer droughts. Clean energy on sunny days, shade from sun during traffic on the motorway, excess of water during drought, less slippery motorway during rain, obviously during a flood the waterways built to be transported to filtering facility would be built to contain flood waters so motorways wouldn't be flooded. The street lights on the motorway can be powered by the energy stored during the day. All it takes is a big water pipe either side of the motorway, solar panels which would send rain off to the sides into gutters that would drain into the water pipes. And a few water filtration facilities placed evenly along the motorway. I would suggest doing this along the motorway going from Takapuna to Silverdale. Obviously do construction at night when there's no traffic. Section off one on ramp to the next off ramp at a time for the convenience of citizens and make sure everyone in Auckland is aware of the plans so they can plan their time and route effectively.

Let me know what you think of my idea

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Let's intensify the inner-city area. I'm against Greenfield developments and urban sprawl.

If we can encourage people to live in the inner City area, we will have a City that we can be proud of.

At the moment the City is not a place to go to in the evenings. It's filled with crime and is not a safe place for a stroll in the evening.

This is due to the fact that inner city workers can't wait to get out of there as soon as work has finished and they go home to the outer areas of Auckland.

This causes massive traffic congestion in the mornings and evenings. We need to reduce this traffic so we can reduce our Carbon Emissions.

We need to try and stop this behaviour by making our city a better place to live.

Stop all green field developments.

We are in Dairy Flat and there is currently a plan to develop a village here along with a RTC that will go right through all the beautiful farmlands.

The Dairy Flat Village is planned in an area that has had significant flooding this year.

Its low-lying flood prone land and now there are plans to use it for housing. This is crazy.

It only encourages more traffic in and out of the city and it isn't good planning with Climate Change needs in mind.

The RTC is planned to go along the best ridge of land in Dairy Flat. It will mean that the best land is used for roading which is shocking.

If there really is a need for a RTC then use the corridor alongside the existing motorway instead of a meandering route along the farmland. This won't be a Rapid Route, it will be just another bus route.

Please abandon the Greenfield developments, lets reduce Carbon emissions by intensifying the inner City, Lets protect the natural environment by not allowing RTC through our best Greenfields.

I strongly oppose the Dairy Flat development and would like to see this area maintained the way it is at present with housing intensified in the City where the infrastructure is already in place.

Other

Tell us why

I disagree with new large scale development outside Auckland, like Dairy Flats.

I think you should be developing more in Auckland itself.

Why spread the city out? All that does is use up good farm land, (where do you think our food will come from in the future)

We have had a huge amount of flooding up here, in Dairy Flats, so I think it is a silly idea to put lots of houses here.

We live in Dairy Flat and you want to put a new Rapid Transport Route through Dairy Flat.

If you want a RTC should it not be a straight line from Auckland to the new city. Making it wind around, to pick up more passengers, it will not be Rapid, and seems a waste of time. Just run it down the side of the existing motorway.

This way it is rapid transport, and you already have the right to do it, so saving on upsetting all the land owners, and keeping the transport corridor together.

All this seems like a waste of money, which clearly Auckland Council and rate payers, don't have.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

I just make some statements of the advantage for the Intensive urban development:

Intensive urban development refers to a comprehensive approach aimed at maximizing the efficient use of land and resources within cities. It focuses on creating compact, well-connected, and sustainable urban environments that accommodate a growing population and address various economic, social, and environmental challenges.

Intensive urban development typically involves the following key aspects:

1. Compact Cities: The concept of compact cities promotes dense and mixed land use patterns, reducing urban sprawl and preserving agricultural and natural areas. By concentrating development, compact cities minimize the need for extensive infrastructure, transportation, and services, leading to increased efficiency and reduced environmental impact.

2. Mixed-Use Development: Intensive urban development emphasizes the integration of different land uses, such as residential, commercial, and recreational, within close proximity. This approach encourages walkability, reduces transportation demand, and fosters vibrant and diverse neighbourhoods.

3. Efficient Transportation: Intensive urban development prioritizes efficient and sustainable transportation systems. This includes promoting public transportation, enhancing pedestrian and

cycling infrastructure, and reducing reliance on private vehicles. Integrated transport planning and smart mobility solutions are often employed to improve accessibility and reduce congestion.

4. Sustainable Infrastructure: Intensive urban development focuses on the development of sustainable infrastructure, including energy-efficient buildings, green spaces, and renewable energy sources. It aims to reduce resource consumption, minimize waste generation, and enhance overall environmental performance.

5. Social Inclusion: Intensive urban development recognizes the importance of social equity and inclusivity. It aims to create affordable housing options, improve access to basic services, and foster social cohesion. It also promotes community participation in decision-making processes to ensure that diverse needs and perspectives are considered.

6. Resilience and Adaptation: Intensive urban development takes into account the challenges posed by climate change and natural hazards. It incorporates resilient design principles, such as flood-resistant infrastructure and climate-responsive building designs, to enhance the city's ability to withstand and recover from shocks and stresses.

By adopting a holistic and integrated approach, intensive urban development seeks to create livable, sustainable, and resilient cities that offer a high quality of life for their residents while minimizing environmental impact and resource consumption.

Accessible local centres

Planning and budgeting are indeed essential to ensure that development initiatives improve people's quality of life rather than disrupt it.

However, when rezoning or removal from the plan is considered, it can have devastating effects, undermining the efforts individuals have put into their lives. This outcome is highly undesirable.

We have confidence that the council will take into account the potential negative consequences and consider alternative approaches that prioritize the well-being of the community. It is crucial to strike a balance between progress and preserving the hard work and hopes of individuals.

Thank you

Disagree

Tell us why

I strongly disagree the FDS.
Auckland is famous for its comfortable living situations. If the community is crowded, the life quality would be impacted, which would result in bad traffic, noise and infrastructure issues. So suggest to consider the countryside which is not far away with current city. Greenfield development must be included in the future urban developing plan with emphasis on areas that have a plan to create sustainable communities, including infrastructure and employment opportunities, which can support future population increase. while not impact the current residents living situation.

Accessible local centres

Disagree

Tell us why

If a city wants to develop, it must develop towards the suburbs, truly achieving road and financial connectivity, reducing housing prices, and attracting outstanding talents, so that society can enter a virtuous cycle of development.

This approach has had a large number of successful cases abroad. When developing suburban areas, a large amount of infrastructure is required. Funds and labor can be solved by referring to other countries using foreign investment or joint ventures (the government does not need to pay, but returns the principal and interest with profits), and labor can also refer to their project system (foreign workers can only complete the project before leaving the country, without affecting domestic labor). Only in this way the comprehensive problems of urban development can be solved to the greatest and fastest extent.

On the contrary, focusing only on the development of urban areas and seeing only short-term benefits has led to a decrease in infrastructure investment, but the consequences are very serious. Firstly, housing prices continue to rise, population is denser, and traffic is more congested. The elements of life that Auckland was once proud of have disappeared, causing Auckland to significantly decline from the world's most livable cities and the outflow of outstanding talents. The consequences are unimaginable.

Therefore, we hope that the government can withdraw this plan as soon as possible. Please don't take the wrong path of urban development.

Accessible local centres

Agree

Tell us why

I support the proposed FDS in general. I believe the proposed FDS would provide much needed clarity for the proposed green field developments and the proposed PC78, given the context of issues such as Special Character Overlay and walking distance catchment etc. in PC78 process .

However, I do believe that following areas could be technically improved:

1. Spatial extent of identified spatial priorities areas:

I note that these identified priority areas are similar size in terms of spatial extent. In particular, the City Centre is slightly smaller than Mount Roskill, westgate, Mangere etc. How come the identified city centre priority area, the ultimate destiny of transit hub, employment centre and commercial hub Which combines the current CBD+ Newmarket Metropolitan Centre would be smaller in spatial extent than that of Mt Roskill, or Mangere, or Albany or Westgate? Neither Mt Roskill nor Mangere is transit hob or employment centre. Westgate and Albany are remote employment centres and have much less magnitude than that of the City Centre. This makes no logical sense at all. They surely are not at the same level of importance. I believe that the hierarchy relationship should be reflected in the spatial extents i.e. the City Centre area could be lightly expanded along arterial roads while other spatial priority areas should be significantly reduced in their spatial extents.

2. Red dots and major projects corridor

- It is interesting to see that the corridors are along Highway 20 and 16, not the railway. One would ask why the council spent such huge investment on CRL? Wairau Valley was worst hit area during Cyclone Gabrielle which demonstrated unsuitability for intensive development. Yet the area is in the major development corridor. It does not make sense Should the railway /train stations be included as the red dots and corridors?

- If the red dot locations are confirmed eventually, it would be helpful to identify their spatial extents, (like the blue areas) to bring more clarity for future development and avoid future dispute

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #4942

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

28 June 2023

Auckland Council
Future Development Strategy | AK Have Your Say (aucklandcouncil.govt.nz)

Dear Sir/Madam

Future Proof Submission to Auckland Future Development Strategy 2023-2053.

The Future Proof partnership is made up of Waikato Regional Council, along with Waikato Iwi, Hamilton City Council, Waka Kotahi (NZ Transport Agency), Waipa District Council, Waikato District Council, Waikato DHB and Matamata-Piako District Council (who joined in 2021). The Future Proof Partnership was expanded in 2019 to include central government, Auckland Iwi and Auckland Council in respect of matters relating to the Auckland-Hamilton corridor. This letter provides a submission on behalf of the Waikato local authority partners of Futureproof only and does not represent the formal views of the full partnership.

Thank you for the opportunity to make a submission on the Auckland Future Development Strategy 2023-2053. Please find attached the Future Proof Waikato local authority partner's submission in regarding this document. This submission was endorsed by Future Proof's Senior Managers Steering Group under delegated authority on 23 June 2023. We look forward to being involved in further discussion on this subject**.**

Should you have any queries regarding the content of this document please contact Robert Brodnax, Future Proof Implementation Advisor, directly on [redacted] or by email futureproofcoordinator@waikatoregion.govt.nz

Regards,

Robert Brodnax
Future Proof Implementation Advisor

Submission from Future Proof Waikato local authority partners on Auckland Future Development Strategy 2023-2053.

28 June 2023

Introduction

1. The Future Proof Waikato local authority partners appreciate the opportunity to make a submission to the Auckland Future Development Strategy 2023-2053. Future Proof's primary interest is in relation to inter-regional connectivity for boundary communities in northern Waikato.

2. We are overall supportive of the Auckland Future Development Strategy (FDS) and note Future Proof is also currently preparing an FDS for the Future Proof sub-region in the Waikato. As a neighbouring region with close commuter and business links to Auckland (particularly in the North Waikato) the directions set in the FDS are of significant interest due to their implications for our own FDS and our communities' ability to connect to services, jobs and opportunities in Auckland.

Submission

3. The draft Auckland FDS does not make sufficiently explicit the connection between the Auckland and Waikato regions. The FDS references the strong associations to Waikato in regard to catchments for rural communities and notes some Auckland businesses have moved to the Waikato due to availability of industrial land. It also mentions the Waikato water treatment plant as an infrastructure project for water supply and the rail connection between Waikato and Pukekohe. However, it fails to recognise the significant cross boundary matters that lie between the two regions.

4. We consider that the strategy should better recognise the cross-boundary matters around the former Franklin area, and with it, opportunities for inter-regional collaboration. The Future Proof Strategy 2022 makes note of this:

   "There is increasing growth in freight, constraints in the road and rail network, pressures on land use, particularly residential and industrial land, and the need for a more coordinated approach between regions …

   The opportunities lie in developing partnerships that allow for joined up planning between Auckland and the Waikato … and the benefits this can bring to communities and businesses."[1]

5. Waikato District towns such as Pookeno and Tuakau function as satellite urban areas of Auckland city, meaning that many people from these townships commute into Auckland for work (and Aucklanders commute to them for work) – as such, these towns also play a function as part of the Auckland centres hierarchy.

6. Attachment 1 to this submission contains a summary of the North Waikato – South Auckland Enhanced Transport Connections report, prepared by Flow Transportation Specialists. The report identifies potential for significant mode change if substantial investment in the transport networks and facilities is committed to walking, cycling and public transport in South Auckland/North Waikato. It also provides evidence of travel movement between Auckland and Waikato.

7. There is need for further consideration of how people in north Waikato interact with the metro area and Drury, and vice versa. As the southern urban edge of Auckland expands, there is increasing demand for business and housing in the northern Waikato district urban areas. The Future Proof Strategy 2022 notes

[1] Future Proof Strategy 2022, page 33. https://futureproof.org.nz/the-strategy/

that the future role of these areas will be defined in consultation with Auckland Council and other stakeholders.

8. We consider there is a need for joined up planning and shared investment between the Auckland and Waikato regions to strengthen the function of transport corridors, enable strong connections between our communities and better enable integrated development in south Auckland and North Waikato. As part of the implementation plan for the FDS we would like to see a commitment to jointly fund development of an integrated transport and land use plan for South Auckland/North Waikato.

9. In particular, there is opportunity to collaborate better to utilise existing rail and road connections between Auckland and Hamilton.

10. A potential additional opportunity for the Pukekohe node, in Appendix 5 of the FDS, would be to partner with Waikato Regional Council and Waikato District Council/Future Proof for discussions around infrastructure and public transport upgrades to service communities on both sides of the regional boundary.

11. Considering Auckland (and Waikato)'s role in the Upper North Island Strategic Alliance (UNISA), and the Government's indication towards spatial planning on a regional and national level as part of Resource Management Reform, we see Future Development Strategies as a key opportunity to recognise inter-regional strategic issues and to align where possible.

EXECUTIVE SUMMARY

Flow Transportation Specialists Ltd has been commissioned by Waka Kotahi to provide transport planning inputs to Phase 1 of the North Waikato - South Auckland Enhanced Transport Connections Programme Business Case (PBC). The PBC considers the future travel needs of the North Waikato and South Auckland, between Drury and Te Kauwhata.

Figure ES1: Indicative area of study showing the area of influence and the area of investigation

This report summarises the data collected through our review of the available transport planning evidence, including land use forecasts, census data and modelled travel demands. Our review has found:

- There are major differences in the various land use forecasts for North Waikato/South Auckland, particularly for Pōkeno, Tuakau and Te Kauwhata
- Understandably, there are differences in the traffic forecasts from the Auckland and Waikato regional transport models, due in part to these differing land use inputs
- Both the Auckland and Waikato regional transport models appear to suffer from 'edge of model' effects within the study area. This is not intended to imply criticism of either model; rather it is an issue to be expected on the edges of regional models of this size.

The key points to note from the land use forecasts for North Waikato include:

- The forecast population in North Waikato in 2055, according to NIDEA, is some 65% higher than that in the Waikato Regional Transport Model (WRTM) for 2051
- The employee to population ratio for North Waikato predicted to be is 0.35, according to WRTM, while according to NIDEA it is predicted to be lower, at 0.26. This implies that, at this stage, the proportion of trips required to leave the townships in North Waikato will increase, due to the predicted lack of local jobs.

For this study we have carried out a series of manual adjustments to the forecast demands. These are considered adequate for the purposes of the study, although a more robust solution is likely to be required for subsequent work. Indeed, given the apparent increase in interactions between North Waikato and South Auckland, there would appear to be merit in extending the Auckland Macro Strategic Model to include the North Waikato area, or in developing an alternative approach to developing reliable travel forecasts for the area.

If existing travel trends (as currently anticipated by the Waikato Regional Transport Model) continue, then significant further increases in traffic can be anticipated within North Waikato/South Auckland. However, WRTM is a traffic model (not a multi modal transport model) and we note the following:

- Investment in active modes (pedestrians and by bicycles) is likely to increase walking and cycling trips within townships, or between adjacent townships
- Greater emphasis should be given to land use combinations that maximise the potential for short trips within townships (ie avoiding the need for some longer distance travel)
- There is significant potential for mode change to public transport, if appropriate investment is made in quality infrastructure and services. This could be in several forms, including a bus based system within North Waikato which connects to the key centres and the rail network to the north, and/or the extension of passenger rail south of Pukekohe, with stations serving the main North Waikato townships. (We of course acknowledge that the Te Huia train service now runs from Hamilton to Auckland, but this is a long distance service that bypasses (i.e. does not stop within) North Waikato)
- North Waikato and South Auckland are dependent to a significant degree on transport networks with limited route choice (i.e. these networks are overdependent on the North Island Main Trunk Line and State Highway 1). Significant changes in travel behaviour, with greater proportions of local trips within townships and shorter trips to work (such as from North Waikato and South Auckland to Drury, rather than further to the north) would appear to be essential, in order to reduce the forecast demands on these networks
- A review of this work should be carried out following any update to Auckland's Macro Strategic model (or the development of alternative approach) that includes public transport and active mode forecasts and a reduction of the edge of model effects identified by this study.

Conclusion

This study has considered the transport implications of significant potential land use change within North Waikato. It has noted that mode shares for trips to/from North Waikato by walking, cycling and public transport are currently exceptionally low, reflecting the current poor provision for these modes, and the rural location of the North Waikato townships, beyond Greater Auckland. The report highlights the potential for significant mode change, which will reduce but not resolve the transport effects of the land use change. However, this will only be achievable if substantial investment in the transport networks and facilities is committed to walking, cycling and public transport in South Auckland/North Waikato, along with commitment to ongoing operating expenditure for public transport and to land use mixes that support these transport modes and reduce average trip lengths.

APPENDICES

APPENDIX A FORECAST LAND USES
APPENDIX B DERIVATION OF TRAFFIC FLOWS BASED ON UPDATED LAND USES AND MODE SHIFT

1 INTRODUCTION

Flow Transportation Specialists Ltd has been commissioned by Waka Kotahi to provide transport planning inputs to Phase 1 of the North Waikato - South Auckland Enhanced Transport Connections Programme Business Case (PBC). The study considers the future travel needs of the North Waikato and South Auckland, between Drury and Te Kauwhata.

The study follows on from an earlier project, the North Waikato Integrated Growth Management PBC. We previously provided transport planning advice to support that PBC in 2017, and this is documented in an earlier Transport Assessment[1].

The investment objectives set out in the PBC are as follows:

- Improve North Waikato's liveability through increased access to, from and within urban growth areas, including to services and amenities, employment areas, town centres
- Enhance Waikato's connectivity through increased effectiveness and efficiency of the multi modal transport network to, from and within urban areas
- Improve national and regional economic growth and performance of the Auckland and Waikato regions by improving interregional connections and connections within the Waikato region
- Deliver on the Future Proof principles and provide infrastructure as required for the North Waikato region and are consistent with development patterns set by Future Proof.

Phase 1 of the study included revision of the evidence base, as recommended in the strategic case. This report summarises the data collected through our review of the available evidence.

In producing this report we have reviewed the following:

- Future land use changes currently allowed for in Auckland's Macro Strategic Model (MSM) for the year 2048, which is currently the furthest forecast year assessed in the MSM
- Future land use changes currently allowed for in the Waikato Regional Transport Model (WRTM) for the year 2051, which is currently the furthest forecast year assessed in the WRTM
- Future land use changes forecast in the Waikato District Council's Growth and Economic Development Strategy document, Waikato 2070 study
- Future land use changes forecast provided in council evidence through the update of the Waikato District Plan
- Current travel demands for commute to work and education trip types, from 2018 census data
- Current travel demands by trip types and by all modes, based on the most recently available base (2013) WRTM and base (2016) MSM
- Future forecast trips based on the most recently available long term forecast WRTM (2051) and MSM (2048).

[1] Flow Transportation Specialists Ltd for the New Zealand Transport Agency. *North Waikato Integrated Growth Management Programme Business Case: Transport Assessment of Short Listed Options*. October 2017

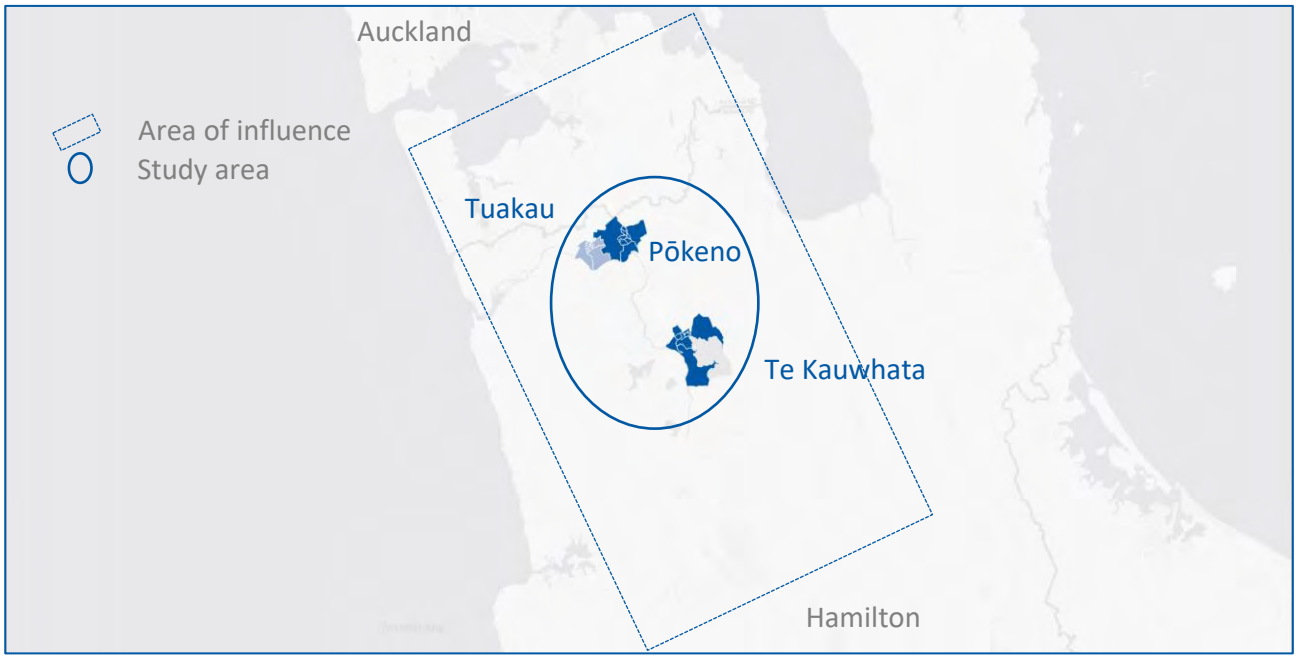

Following consultation with Waikato District Council and Auckland Council, we have reviewed:

- Future high land use changes forecast provided by the National Institute of Demographic and Economic Analysis (NIDEA)
- The various land use forecasts and we have manually adjusted travel demands from the WRTM and/or MSM accordingly
- The proportions of forecast trips that are within distances that may be considered "walkable or cyclable", and we have considered what proportions of these trips may reasonably be assumed to change from car-based travel
- The proportions of forecast trips that are between origins and destinations that are currently assumed to be served by public transport, or freight trips, and we have considered what proportions of these trips may reasonably be assumed to change from car (or truck)-based travel.

2 THE STUDY AREA

From the assessment of growth forecasts within the study area (see Section 3) we have identified Tuakau, Pōkeno, and Te Kauwhata as communities expecting significant development in the future. These communities are considered the key origins for our study. The study area is indicated in Figure 1 with an approximate area of influence including likely origins and destinations for the highlighted key communities of Tuakau, Pōkeno, and Te Kauwhata. We have also included Pukekohe to further compare the MSM and WRTM models.

Figure 1: Indicative area of study showing the area of influence and the area of investigation

3 LAND USE FORECASTS FOR THE NORTH WAIKATO

In the following section we review and compare the various land use forecasts for the North Waikato towns. Sources of land use data include:

- The Waikato Regional Transport Model (WRTM)
- Auckland's regional transport model, the Macro Strategic Model (MSM)
- Waikato 2070 – the Waikato District Council's Growth and Economic Development Strategy
- The Waikato District Council's District Plan review[2]

We note that Waikato 2070 provides forecasts for population only, while the District Plan review provides only household forecasts. The two forecasts are consistent however, if we assume between 2.3 and 3.0 persons per household. As a result, we have presented only the population forecasts from Waikato 2070 in the following section.

Work is currently progressing on an update of the WRTM to a 2018 base. However, projections of future travel patterns from this base are not expected to be developed until late 2021. As a result, we have used outputs from the previous, 2013 base model for our analysis, including the future year forecasts up to 2051 from that base. The MSM base is from 2016.

Comparisons of land use assumptions between the two models, and from Waikato 2070 where available, are presented on the following pages. We note that

- Most, if not all, North Waikato communities are expected to see growth in households, population, and employment
- The MSM and WRTM have minor discrepancies when forecasting households within the South Auckland region
- The three data sources have substantial differences in forecasts for North Waikato communities.

[2] Waikato District Council. 19 January 2021. Proposed Waikato District Plan Section 42A Report: Hearing 25 Zone Extents Framework Report

3.1 Population forecasts

Figure 2: Population Forecasts
Pukekohe and Paerata

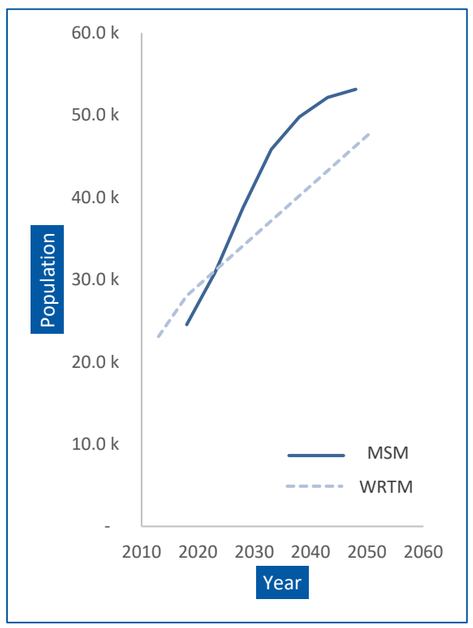

Figure 3: Population Forecasts
Drury

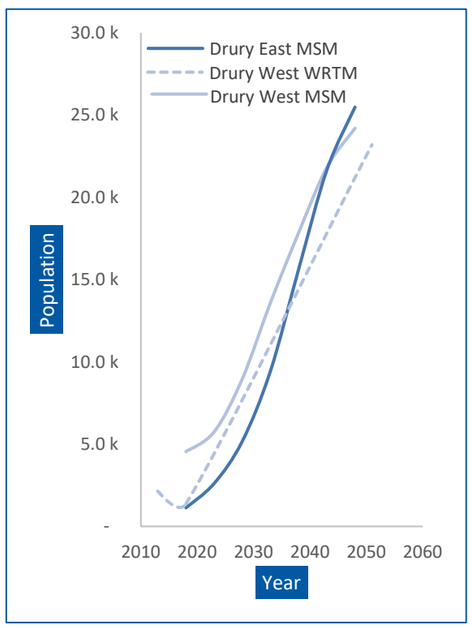

Figure 4: Population Forecasts
Tuakau

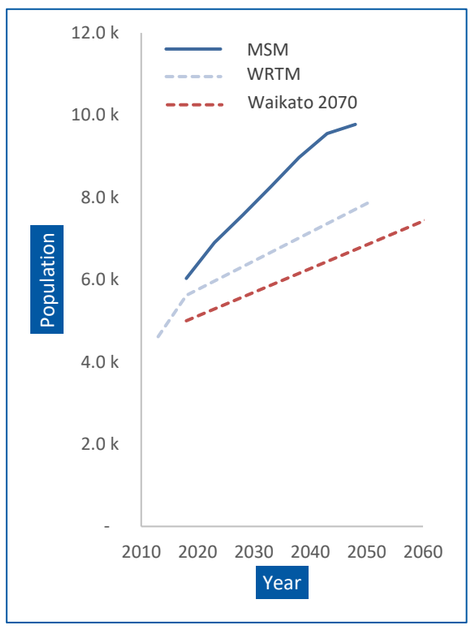

Figure 5: Population Forecasts
Pōkeno

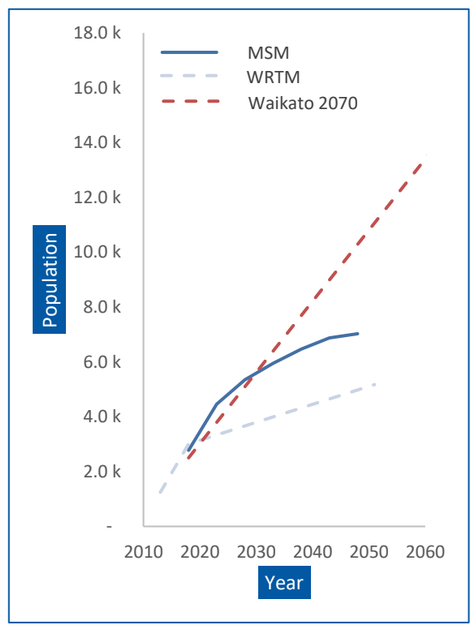

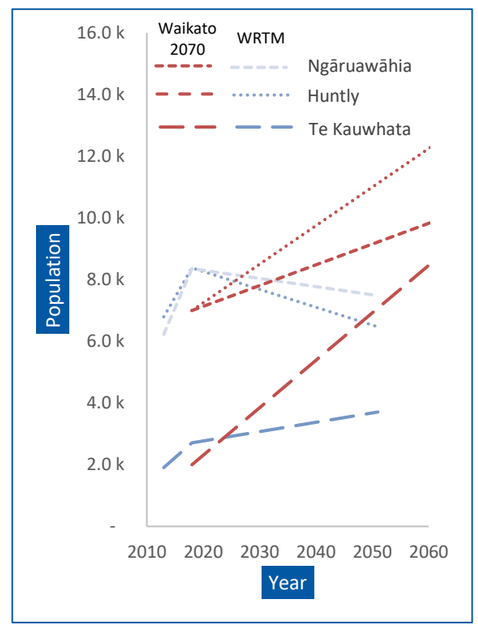

Figure 6: Population Forecasts
Ngāruawāhia, Huntly and Te Kauwhata

We note that

- Substantial population growth is expected within most, if not all, communities
- The WRTM predicts negligible growth in households within Huntly and Ngāruawāhia, which is contrary to the Waikato 2070 forecasts
- The overall predicted population growth in the southern part of the Auckland region (Pukekohe, Paerata and Drury) is similar for the MSM and WRTM models
- Absolute growth within Pukekohe (+30,000 residents) and Drury (+50,000) is substantially greater than in the North Waikato towns (generally +1,000 to +10,000)
- The three data sources differ in terms of the assumed growth of Tuakau, Pōkeno and Te Kauwhata
  - in Tuakau, the WRTM estimates 7,900 residents in 2051, while the MSM estimates 10,300 in 2048, and Waikato 2070 estimates 8,000 in 2070
  - in Pōkeno, the WRTM estimates 5,200 residents in 2051, while the MSM estimates 7,400 in 2048, and Waikato 2070 estimates 16,000 in 2070
  - in Te Kauwhata, the WRTM estimates 3,700 residents in 2051, while Waikato 2070 estimates 10,000 in 2070
- It may therefore be appropriate to apply factors to trip outputs from the WRTM and/or MSM, to align the various land use forecasts.

We also note that the WRTM includes Drury West, but not Drury East.

3.2 Employment forecasts

Figure 7: Employment Forecasts Pukekohe and Paerata

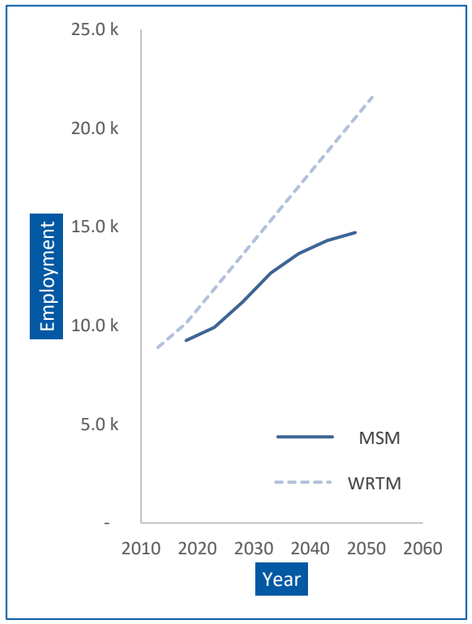

Figure 8: Employment Forecasts Drury

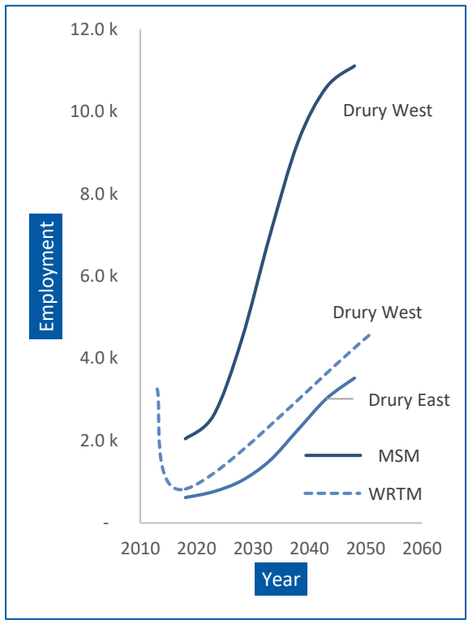

Figure 9: Employment Forecasts Tuakau

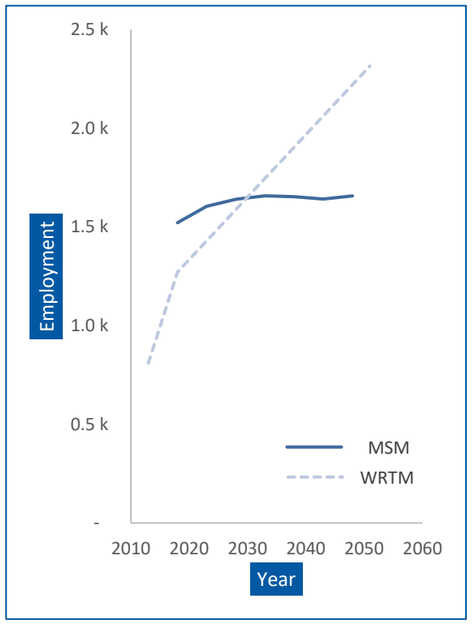

Figure 10: Employment Forecasts Pōkeno

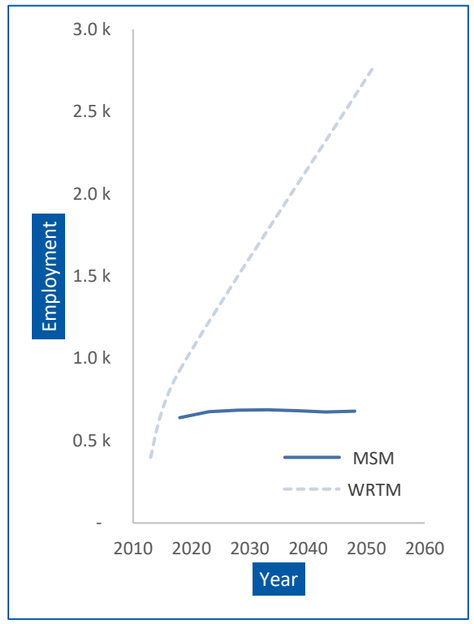

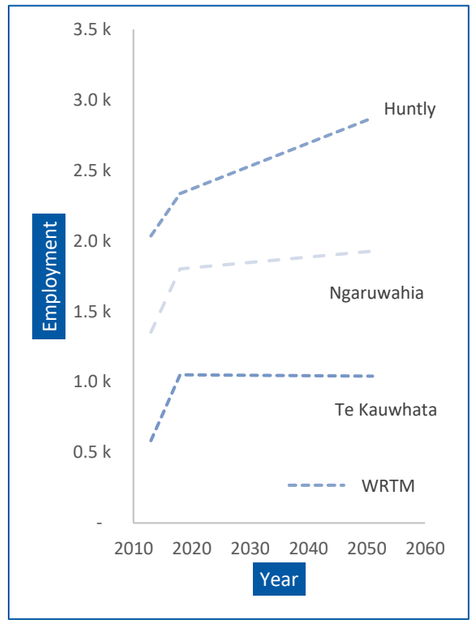

Figure 11: Employment Forecasts Ngāruawāhia, Huntly and Te Kauwhata

We note that:

- There are significant differences between the two models' employment growth forecasts, with
  - the MSM assuming 15,000 jobs within Pukekohe and Paerata, and the WRTM assuming 22,000
  - the MSM assuming 11,000 jobs within Drury West, and the WRTM assuming 4,600 (the WRTM excludes Drury East)
  - the MSM assuming 1,700 jobs within Tuakau, and the WRTM assuming 2,300
  - the MSM assuming 700 jobs within Pōkeno, and the WRTM assuming 2,800
- Combining Pukekohe, Paerata and Drury West however, both models agree with approximately 26,000 jobs
- Reviewing the local employment opportunities per household equivalent[3], the MSM has a lower number of local jobs per household in Tuakau (0.27) and Pōkeno (0.47) compared to the WRTM predictions (1.20 and 0.95)
- For Pukekohe, Paerata and Drury West, overall local jobs per household are predicted to be lower in MSM (0.87) compared to WRTM (1.0)
- The implication is that the two models differ in terms of the quantity of local employment opportunities within Tuakau and Pōkeno, and therefore also differ in the number of employment trips assumed to be made to other employment areas. For example, assuming that the employment opportunities in these communities can be undertaken by people living in the community, then the WRTM model will predict few employment trips need to be made out of the local area, whereas the MSM model will predict a much larger number.

[3] Assuming the national average of 2.7 people per household

3.3 Summary

As a result of the above analysis, and following consultation with the Auckland Forecasting Centre and Waikato District Council, we consider that the following land use assumptions should be used for this study, as shown in Table 1 and Table 2. The population and employment values are the total from North Waikato communities so the WRTM can be directly compared with the NIDEA forecasts. These include Tuakau, Pōkeno, Te Kauwhata, Huntly, and Ngāruawāhia, whereas the South Auckland communities (Drury, Pukekohe, Paerata) are compared with the MSM. The disaggregated NIDEA forecasts are provided in Appendix A.

Table 1: Summary of population and employment in North Waikato communities

	Population		Employees	
	WRTM	NIDEA	WRTM	NIDEA
Base 2018	28,420	29,030	7,500	7,200
Forecast 2051	31,900	52,900	11,320	13,520
2055 (to be used for this study)	52,900		13,520	

Table 2: Summary of population and employment in South Auckland communities

	Population		Employees	
	WRTM	MSM	WRTM	MSM
Base 2018	29,400	29,000	10,900	11,300
Forecast 2051	71,300	77,300	26,200	25,800
2048 (to be used for this study)	77,300		26,200	

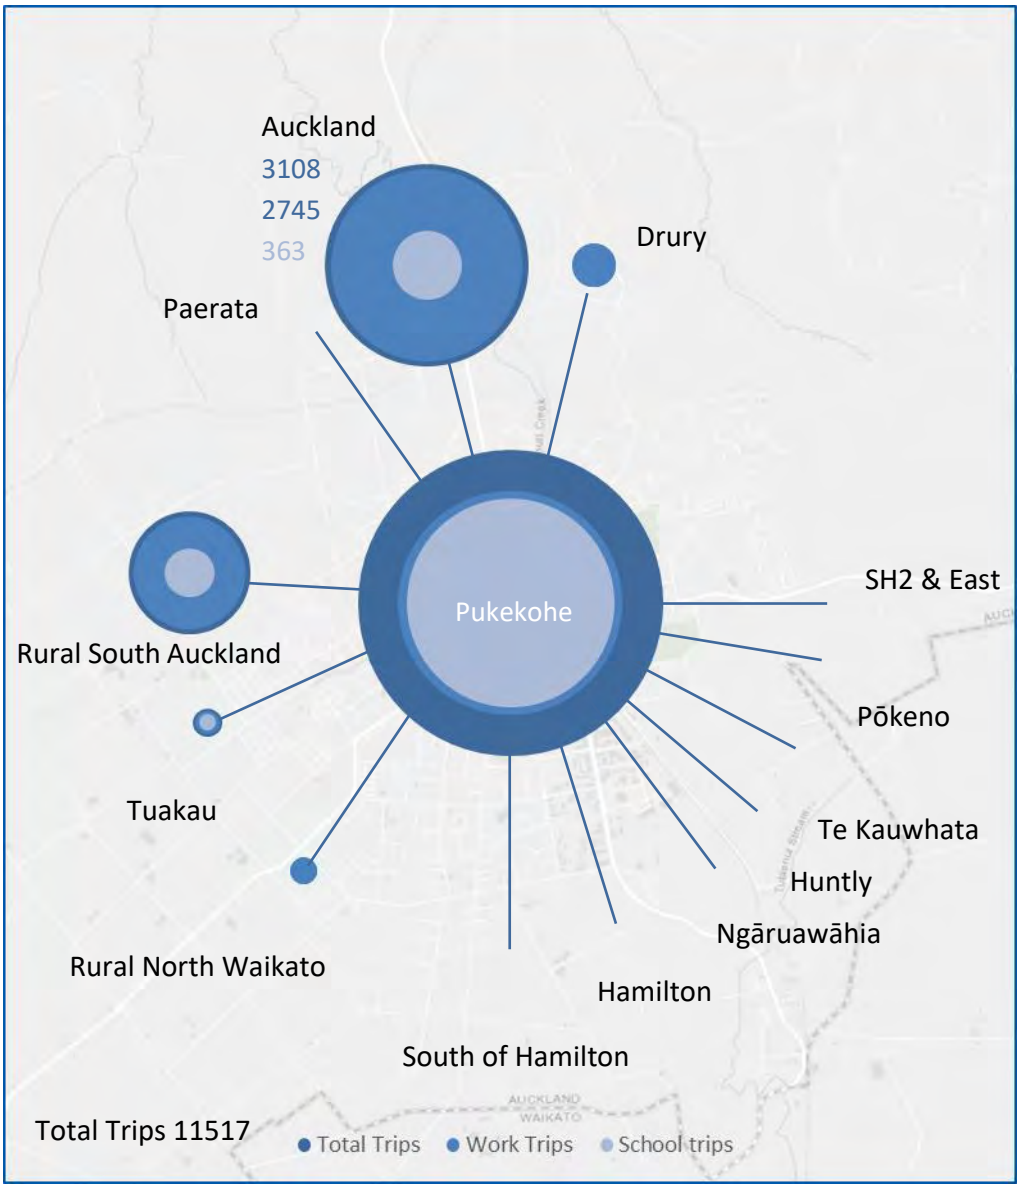

The key points to note from the above tables are as follows.

- The forecast population in North Waikato, according to NIDEA, is some 65% higher than that in WRTM
- The employee to population ratio for North Waikato predicted to be is 0.35, according to WRTM, while according to NIDEA it is predicted to be lower, at 0.26. This implies that, at this stage, the proportion of trips required to leave the townships in North Waikato will increase, due to the predicted lack of local jobs.

4 EXISTING TRAVEL PATTERNS

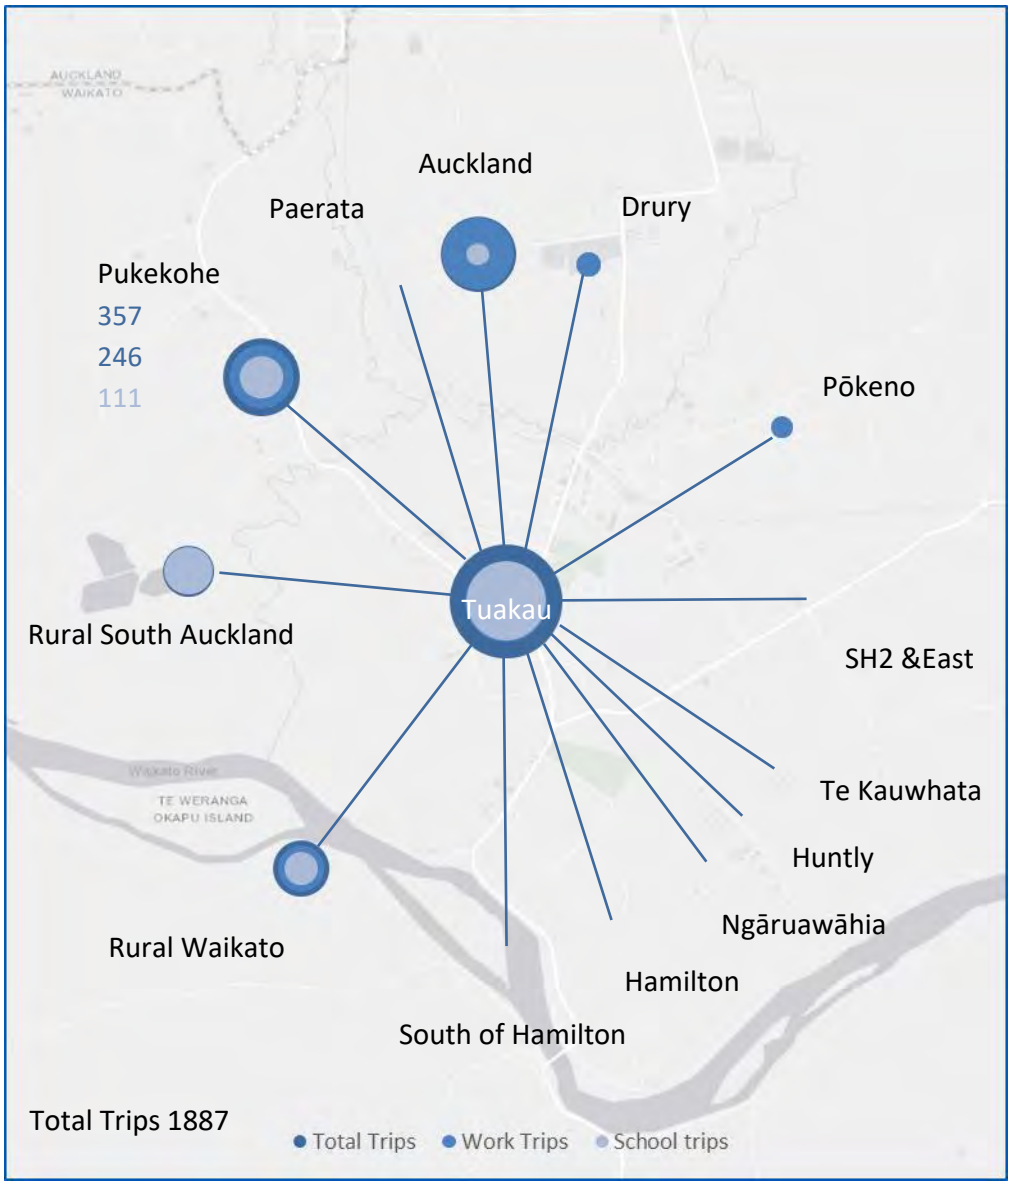

The existing travel patterns have been obtained from Stats NZ Tatauranga Aotearoa from the 2018 Census. The travel patterns are illustrated in the following figures, and include the daily commute trips to work and to school.

Figure 12: Total daily commute to work/education trips originating in Pukekohe from the 2018 Census

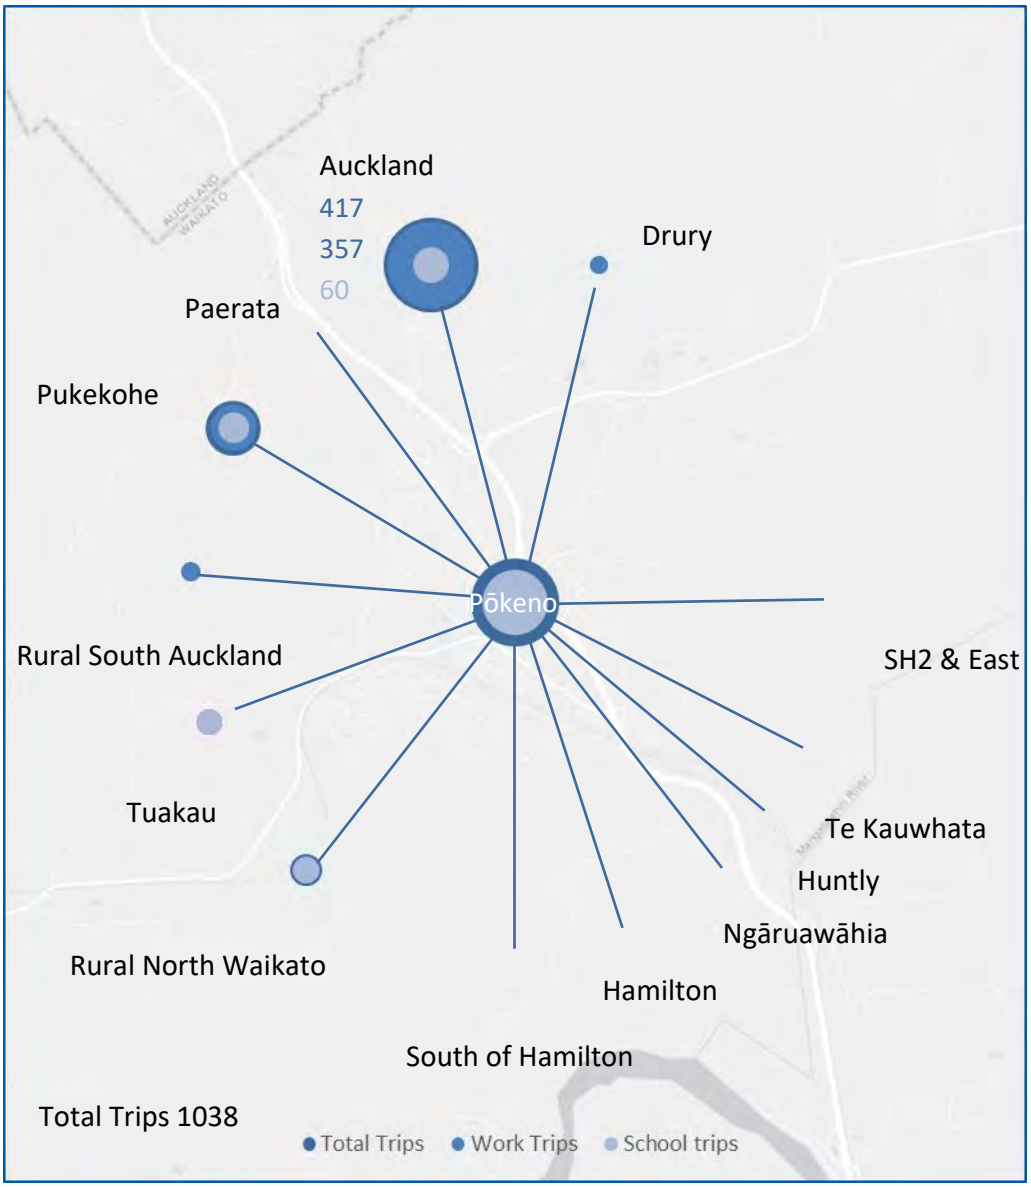

The majority of Pukekohe's existing commute to school trips are internal trips within Pukekohe, while commute to work trips are distributed between Pukekohe, Auckland and rural Auckland.

Figure 13: Total daily commute to work/education trips originating in Tuakau from the 2018 Census

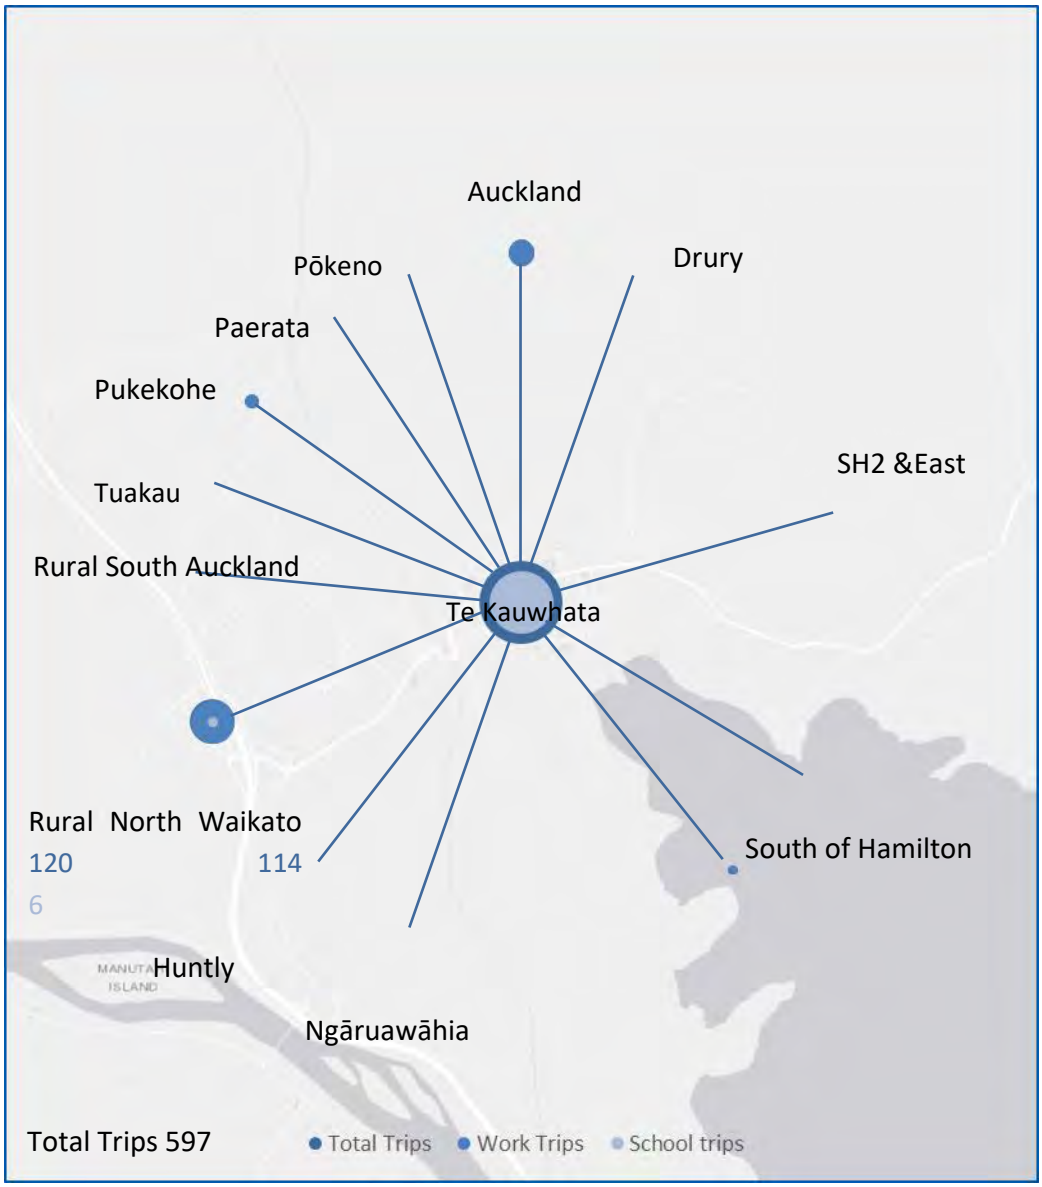

Like Pukekohe, the majority of Tuakau's existing commute to school trips are internal. Trips to employment are generally internal, to Auckland or to Pukekohe.

Figure 14: Total daily trips commute to work/education originating in Pōkeno from the 2018 Census

Pōkeno is less self sufficient in terms of employment than either Pukekohe or Tuakau, and the majority of existing employment trips are to jobs in Auckland. The majority of trips to school are internal.

Figure 15: Total daily commute to work/education trips originating in Te Kauwhata from the 2018 Census

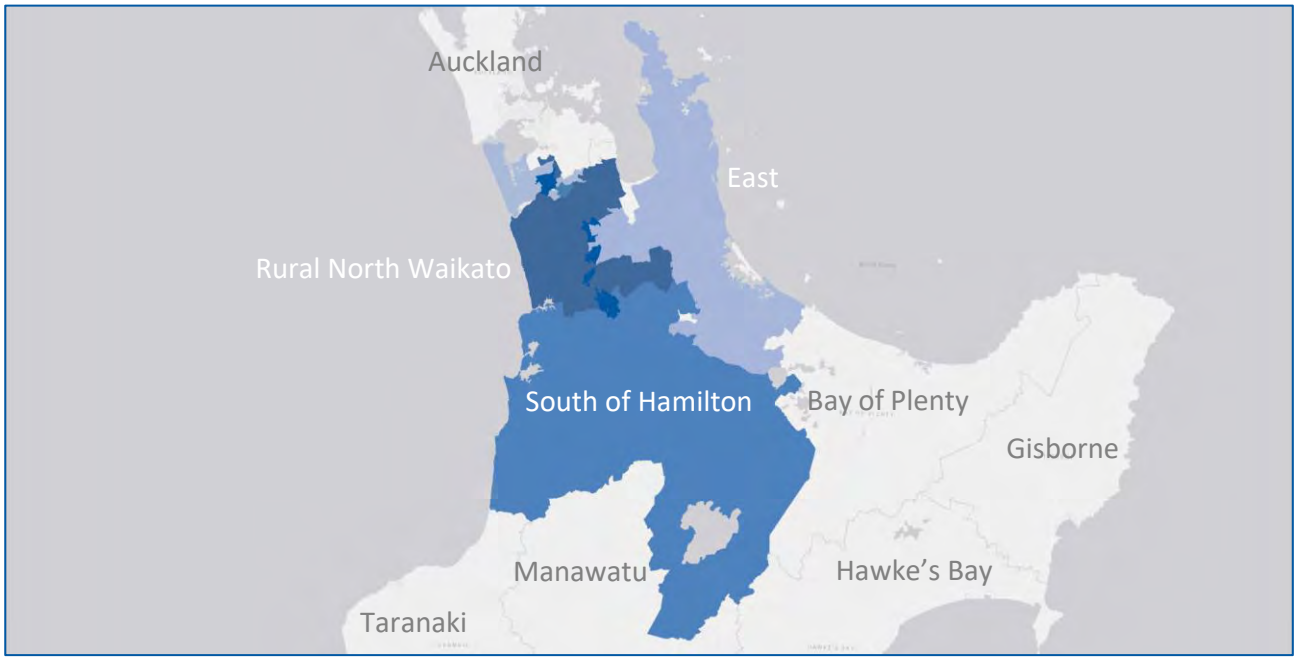

Like Pōkeno, Te Kauwhata's trips to education are generally internal, while almost all commute to work trips are external – in this case to rural areas.

5 MODELLED TRAVEL PATTERNS

We have obtained trip matrices from the MSM and WRTM, and have sectored the zones within these models into 14 sectors. Those sectors are illustrated in Figure 16 and Figure 17, and include

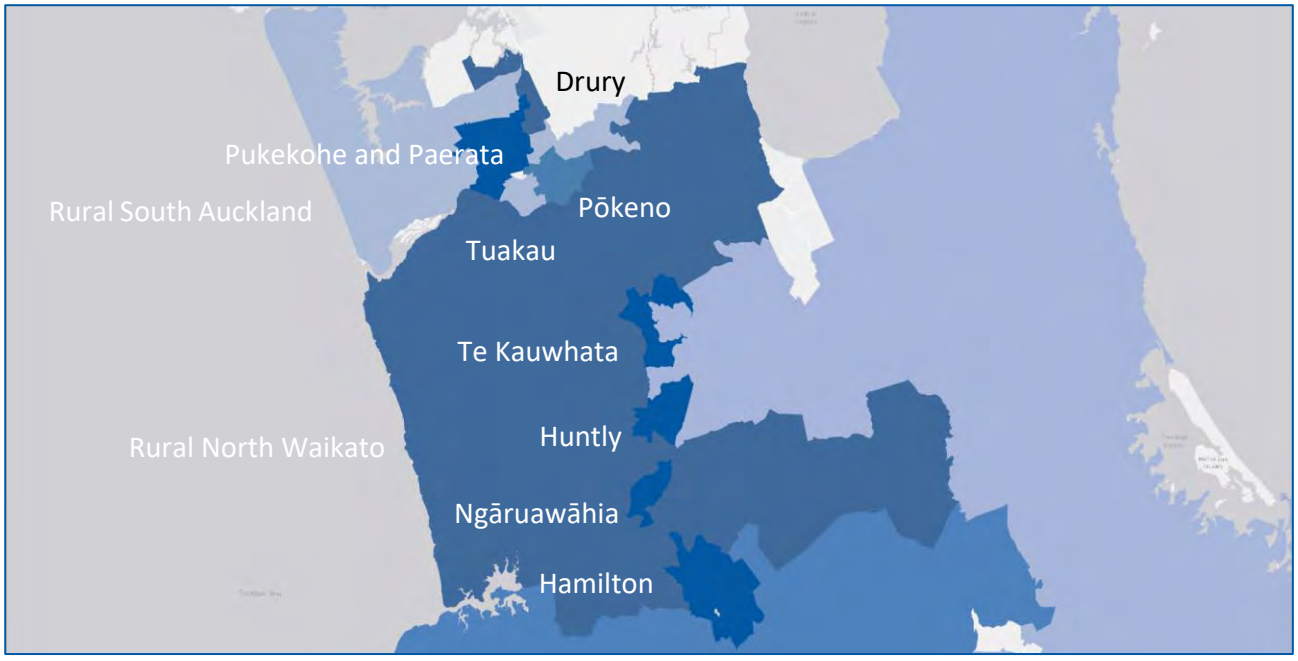

- Auckland[4]
- rural south Auckland areas
- Drury
- Paerata
- Pukekohe
- Tuakau
- Pōkeno
- rural north Waikato areas (WRTM only)
- Te Kauwhata (WRTM only)
- Huntly (WRTM only)
- Ngāruawāhia (WRTM only)
- Hamilton (WRTM only)
- areas south of Hamilton (WRTM only)
- areas east of Hamilton (WRTM only)

Figure 16: WRTM and MSM zones sectored into communities that influence the study area

[4] Auckland refers to the entire Auckland region, north of the other Auckland sectors identified

Figure 17: WRTM and MSM zones sectored into communities that influence the area of study

We have reviewed the sectored trip data from the two models to determine the trips in and out of the study area, focussing on Tuakau, Pōkeno and Te Kauwhata. The figures on the following pages illustrate the morning peak period trips out of Pukekohe, Tuakau, Pōkeno, and Te Kauwhata, from the respective base and forecast models.

The figures include:

- Trips to work
- Trips to education
- Other trip types, including shopping, social, recreation, and other trips as identified by the two models.

Within each figure, we have included the overall number of trips, as well as the number of trips of each type to the most popular destination, to illustrate scale.

When comparing the figures in the following pages to the census travel data presented previously in Section 4, we note that:

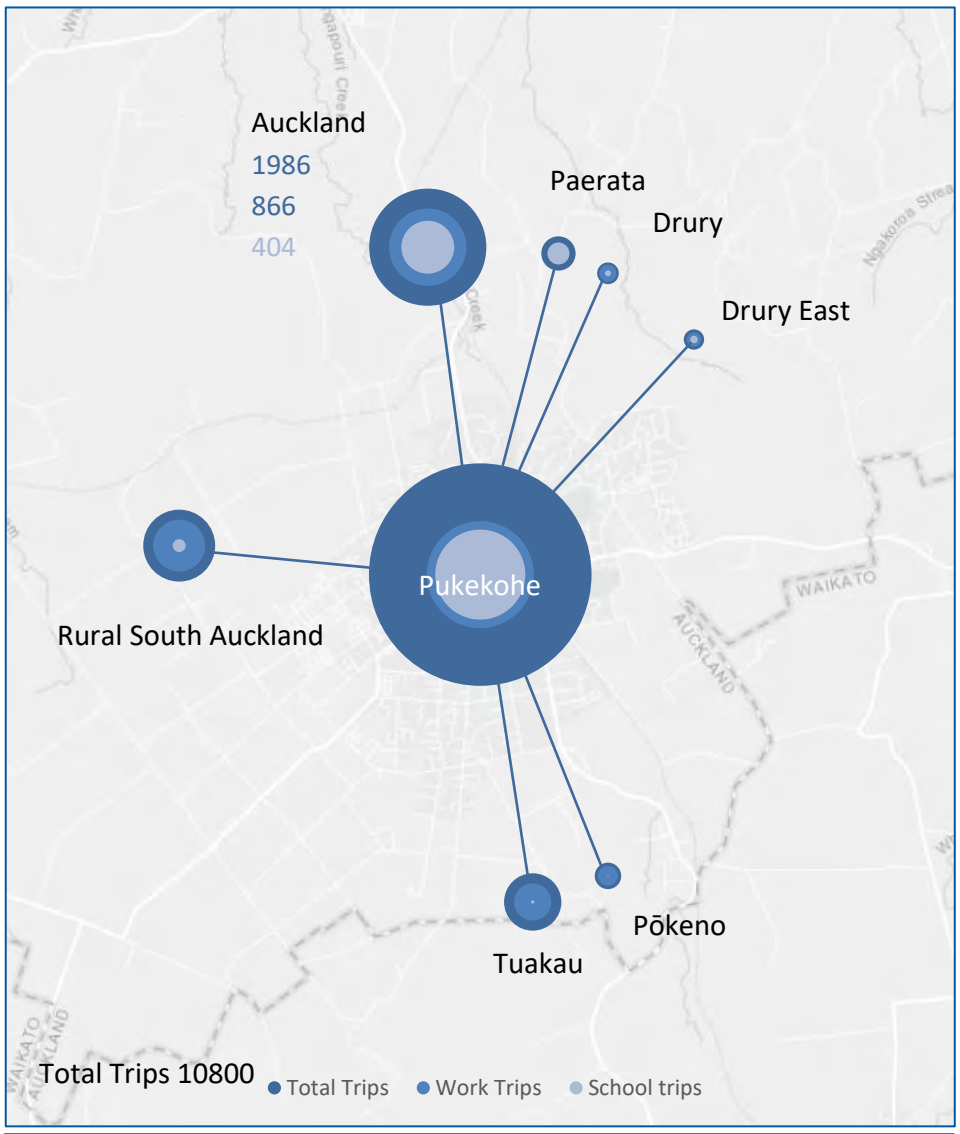

- The census data contains only commute trips to work and education, while the model data also includes other trip types
- The census data represents all day travel, while the model data represents only the morning peak period as output from the MSM and WRTM.

While the Auckland Forecasting Centre (AFC) intends to extend and refine the southern extent of the MSM into North Waikato, this work has not yet begun. As a result, the MSM includes Tuakau and Pōkeno, but no areas further south.

The WRTM includes Pukekohe and Drury West, but excludes Drury East.

5.1 Pukekohe

Figure 18: Morning peak period trips originating in Pukekohe in 2016 (top) and forecast for 2048 (bottom) based on the MSM

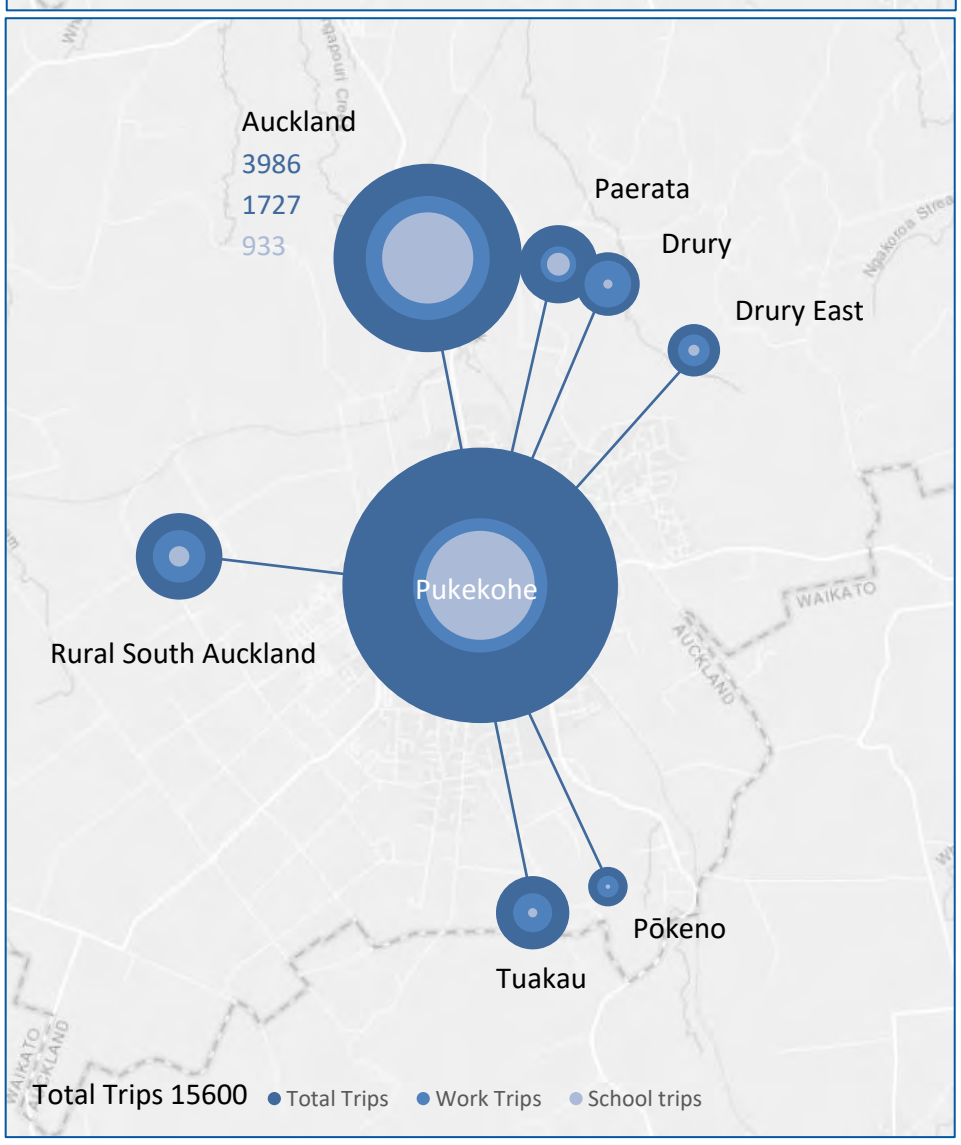

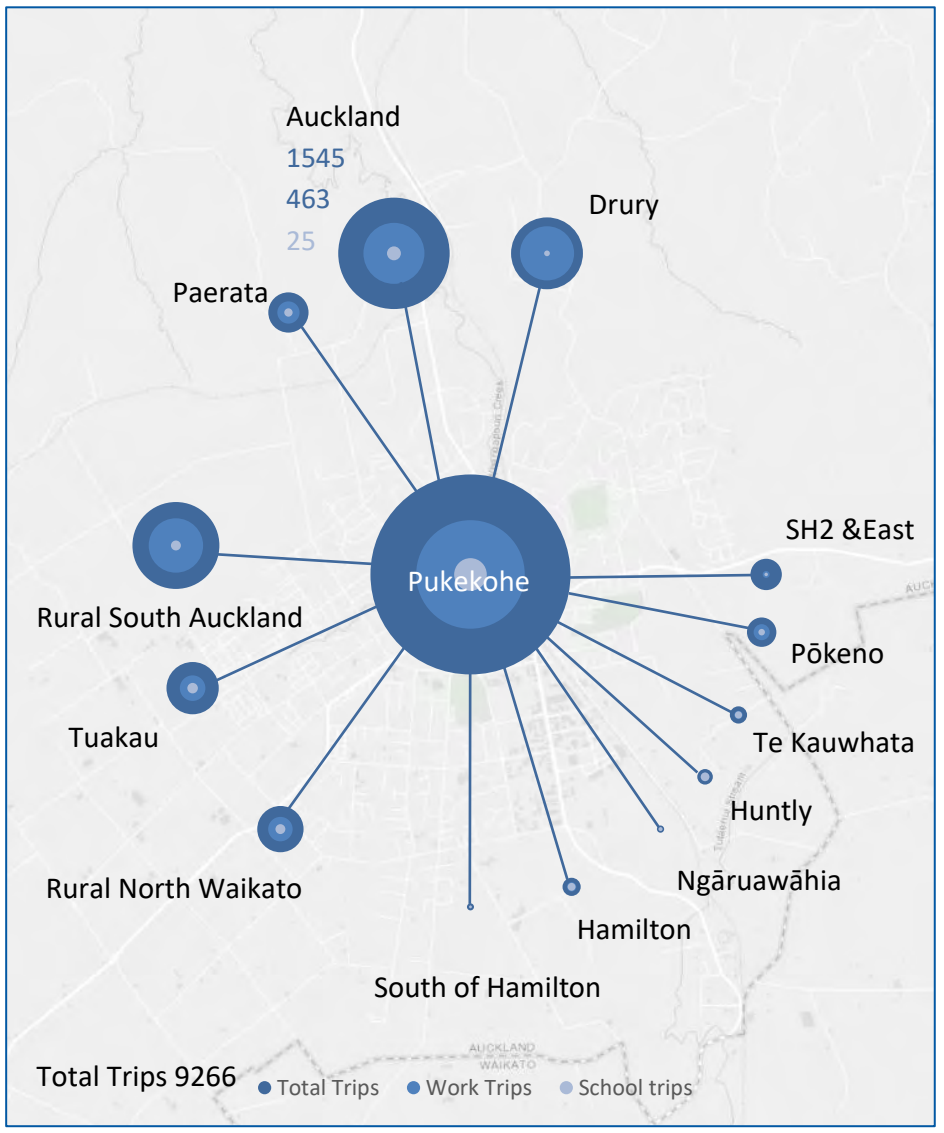

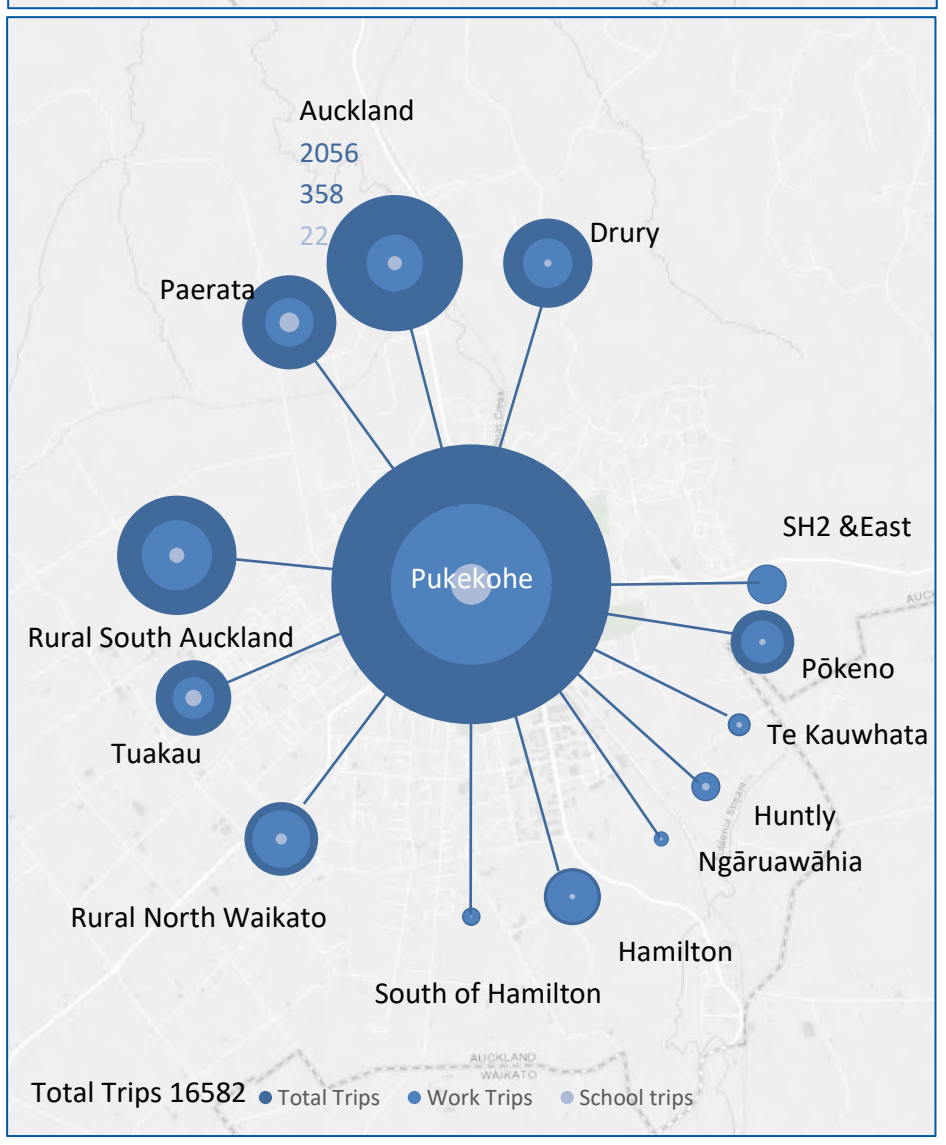

Figure 19: Morning peak period trips originating in Pukekohe in 2013 (top) and forecast for 2051 (bottom) based on the WRTM

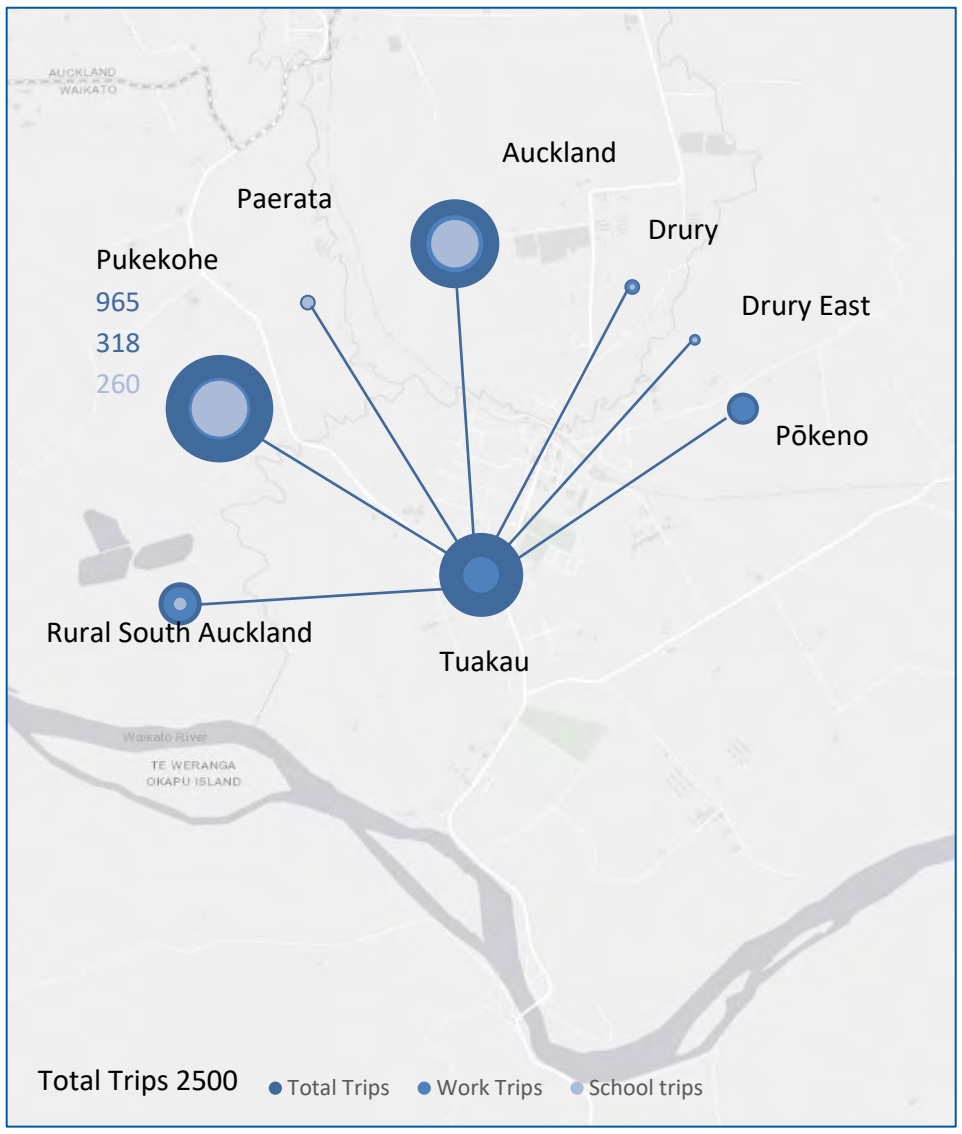

Currently, the majority of Pukekohe's trips to work and school are internal or to Auckland (refer to the census data in Figure 12 previously). Both the MSM and WRTM base models agree with this.

In terms of forecast trips, both models predict a substantial number of internal trips within Pukekohe. Most of the external trips are predicted to be to Auckland, with very few trips to Tuakau, Pōkeno or further south. This represents a continuation of existing Pukekohe travel patterns, although the forecast proportion of trips from Pukekohe to Auckland is much lower according to the WRTM than the MSM.

5.2 Tuakau

Figure 20: Morning peak period trips originating in Tuakau in 2016 (top) and forecast for 2048 (bottom) based on the MSM

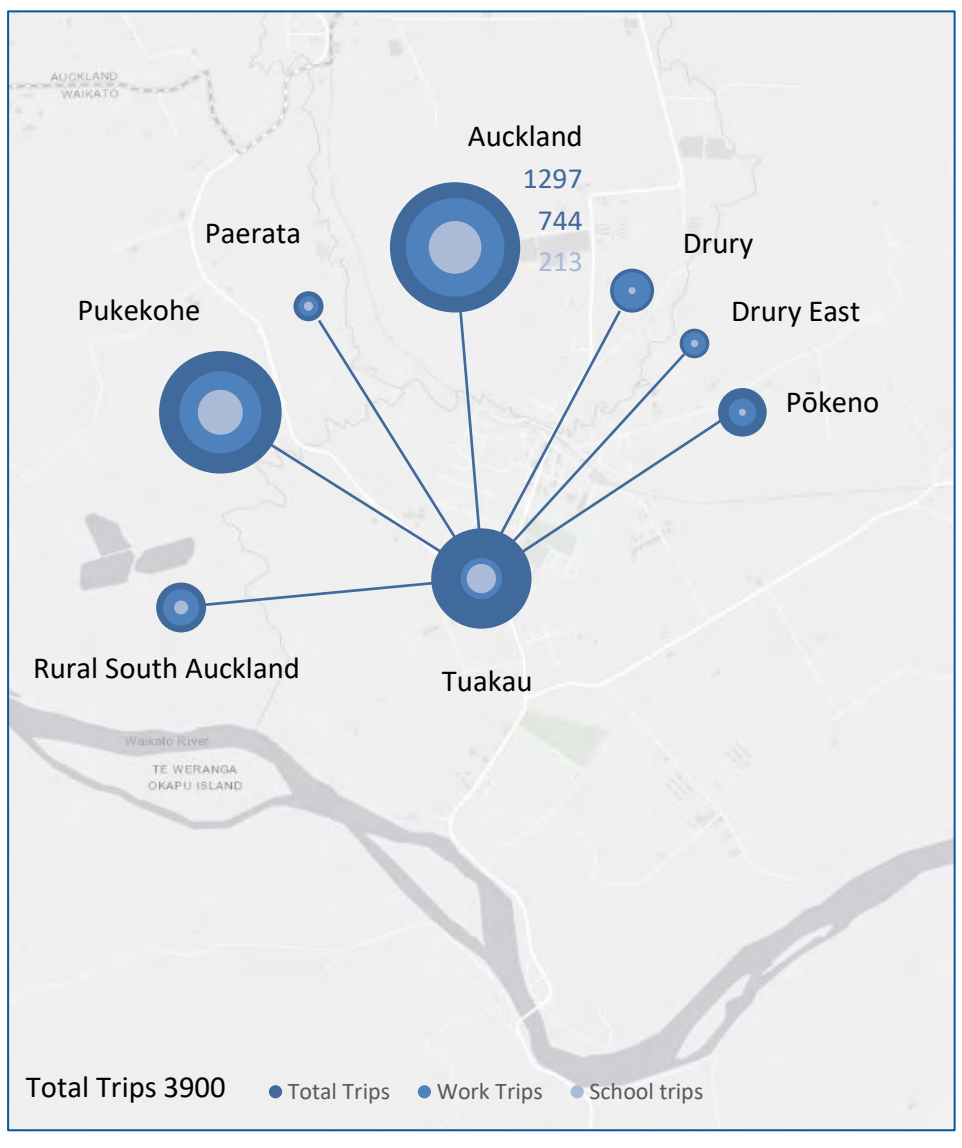

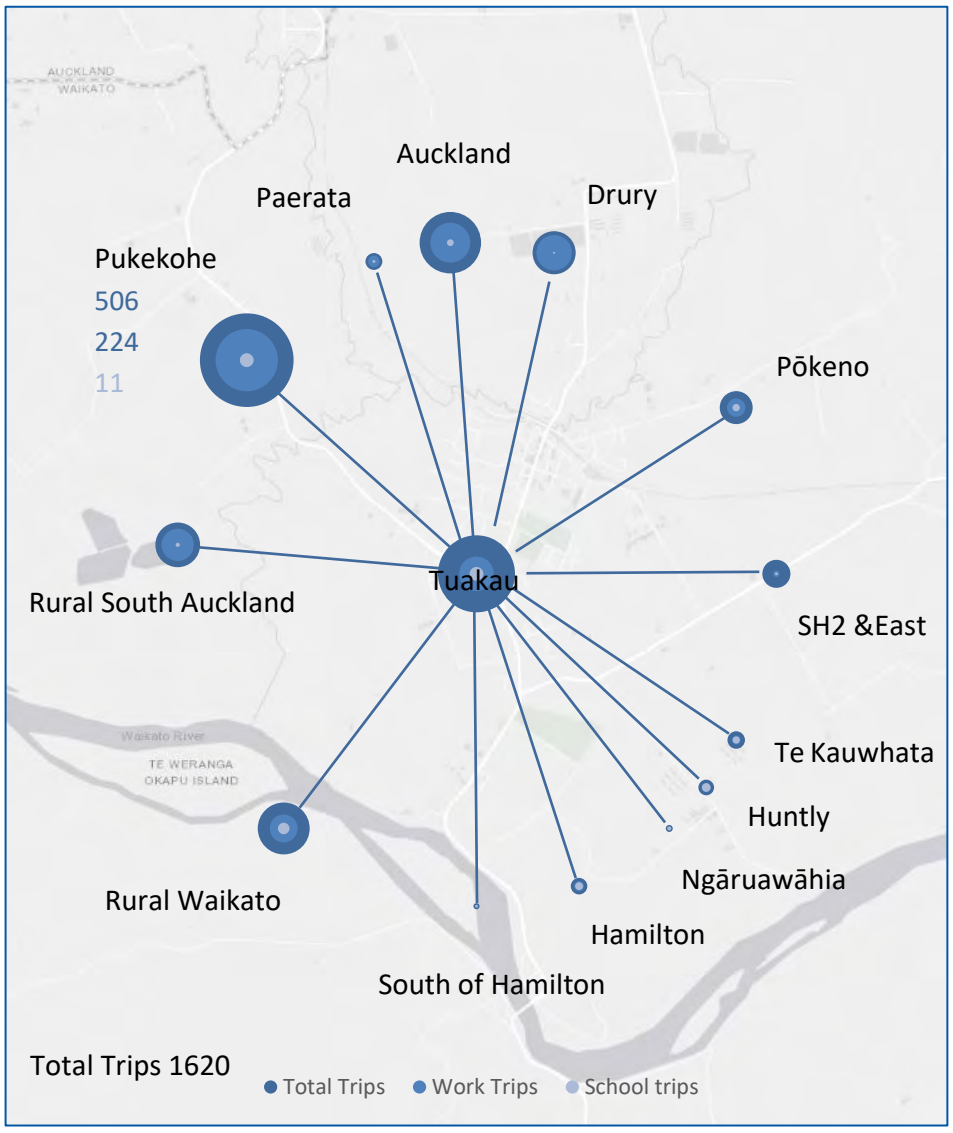

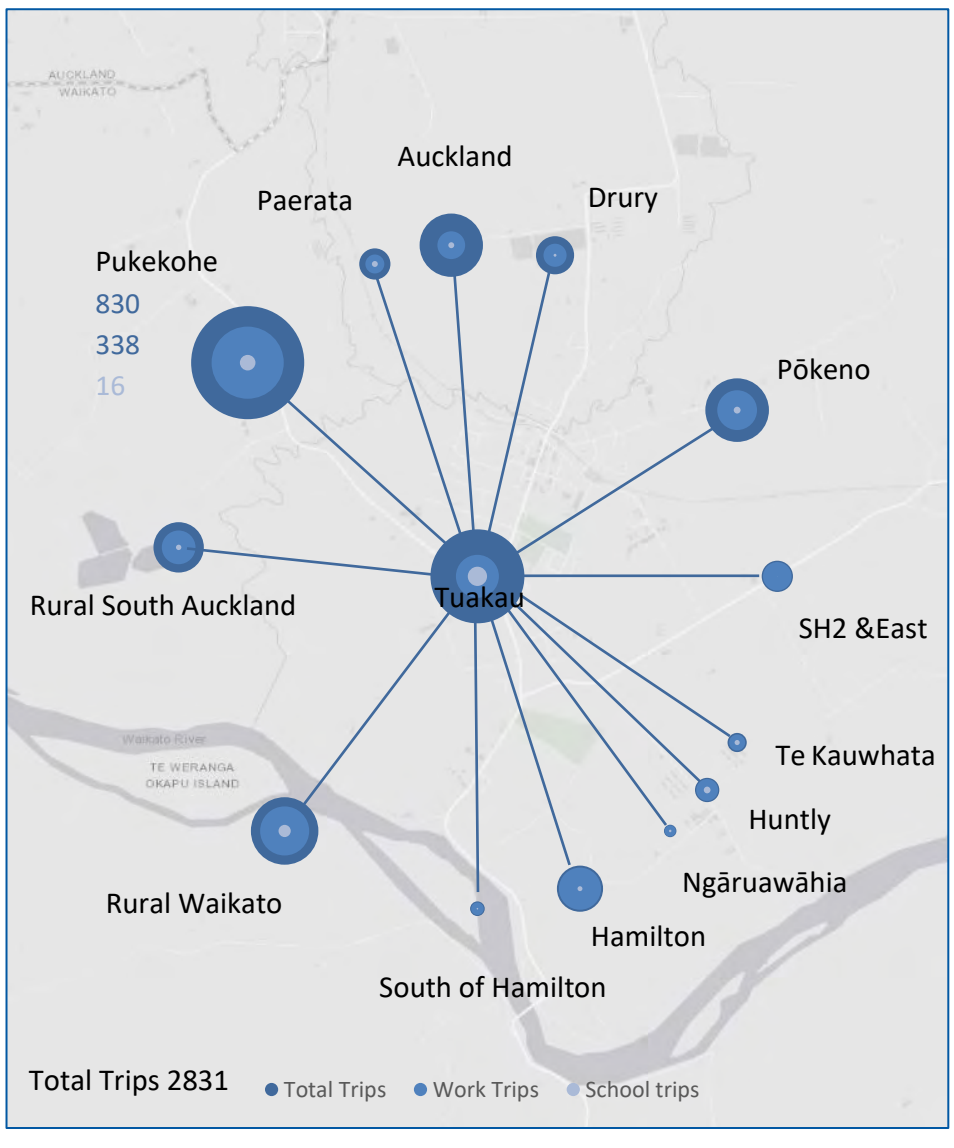

Figure 21: Morning peak period trips originating in Tuakau in 2013 (top) and forecast for 2051 (bottom) based on the WRTM

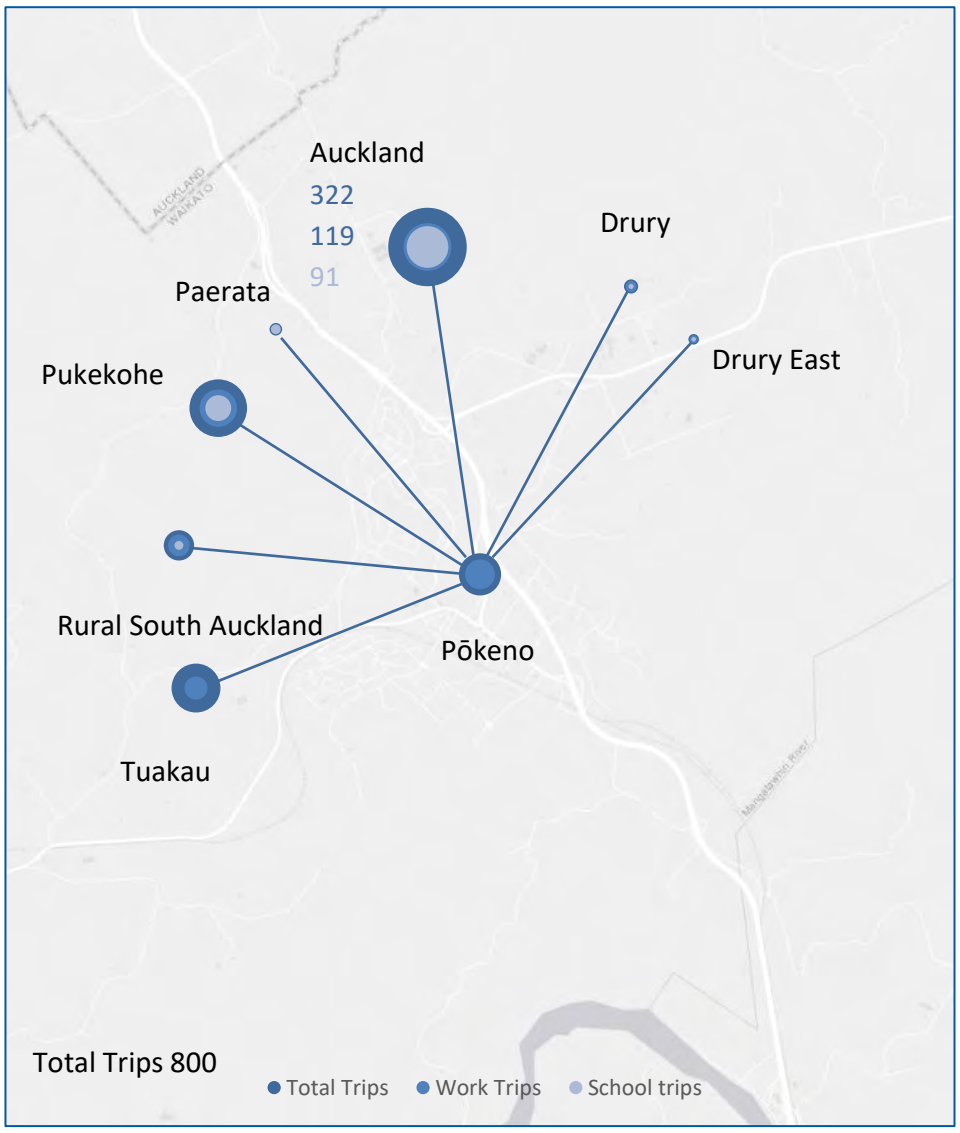

Currently, the majority of Tuakau's trips to work and school are internal, to Auckland or to Pukekohe (refer to the census data in Figure 13 previously). Both the MSM and WRTM appear to overestimate the proportion of trips to Pukekohe, and underestimate internal trips. This may be the result of different area definitions between census data and the models.

In terms of forecast trips, the MSM predicts considerable growth in trips for all purposes to Pukekohe and Auckland, and few trips elsewhere. The WRTM predicts growth in trips to Pukekohe only, with some increases to Pōkeno and rural Waikato areas. This may in part be due to the differences in land use assumptions, with the WRTM based on higher employment and lower population forecasts within Tuakau than assumed in MSM, but is also likely to relate to the fact the majority of Auckland is represented by a single external zone in the WRTM.

5.3 Pōkeno

Figure 22: Morning peak period trips originating in Pōkeno in 2016 (top) and forecasted for 2048 (bottom) based on the MSM

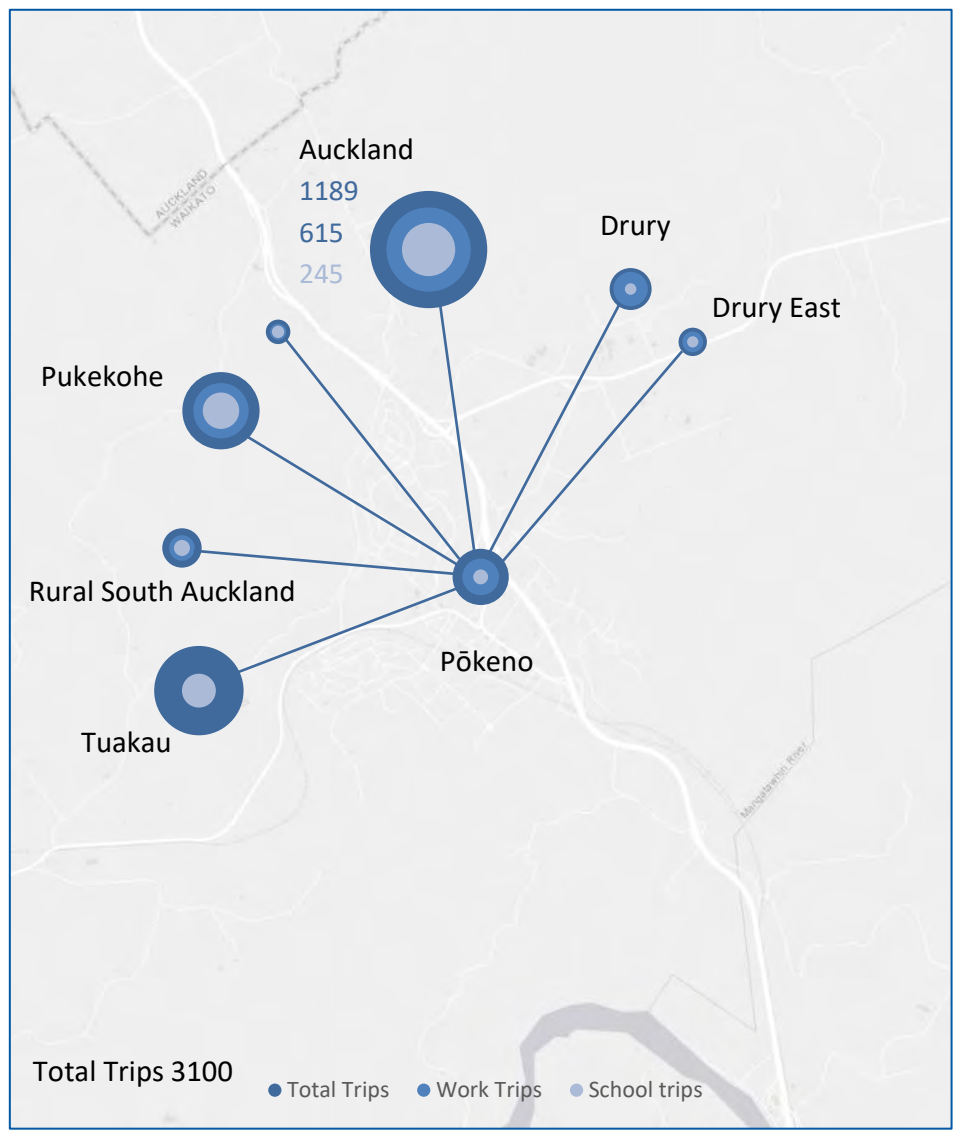

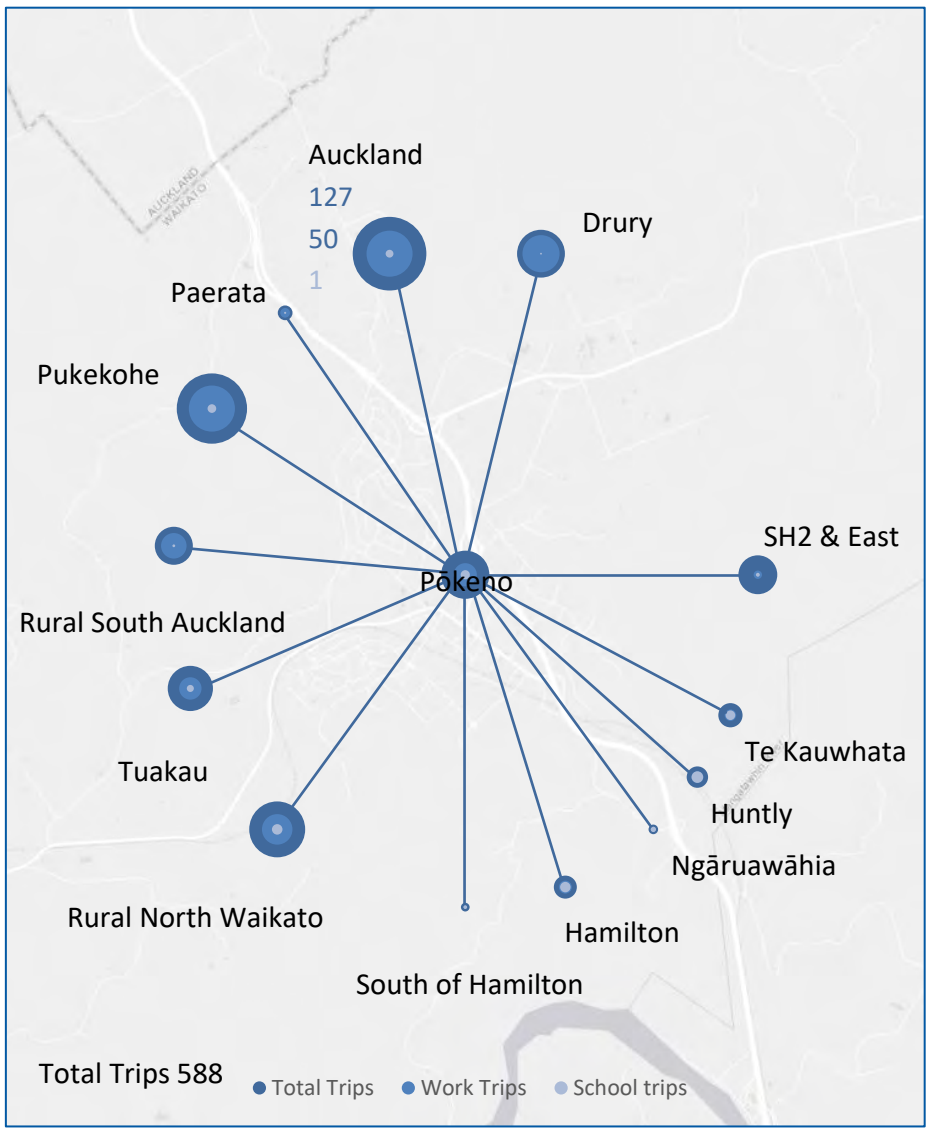

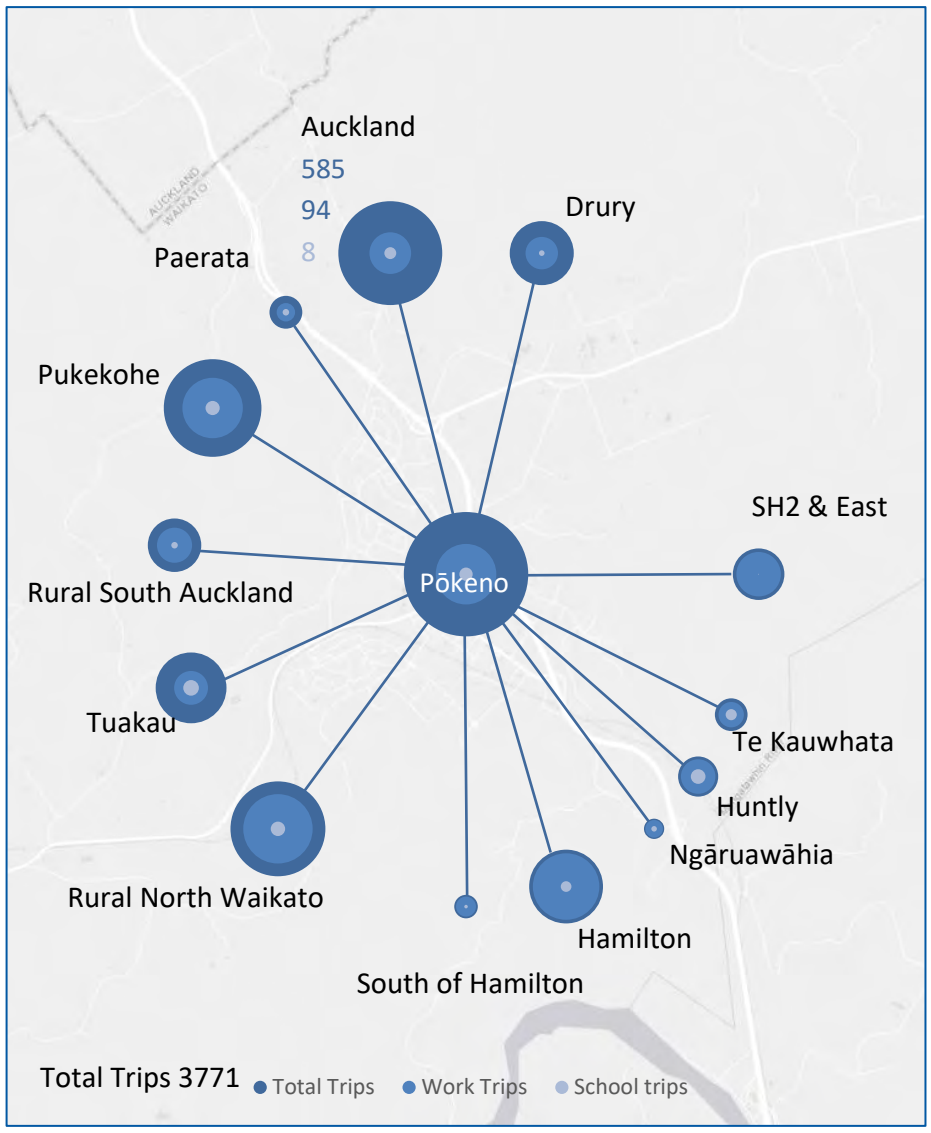

Figure 23: Morning peak period trips originating in Pōkeno in 2013 (top) and forecasted for 2051 (bottom) based on the WRTM

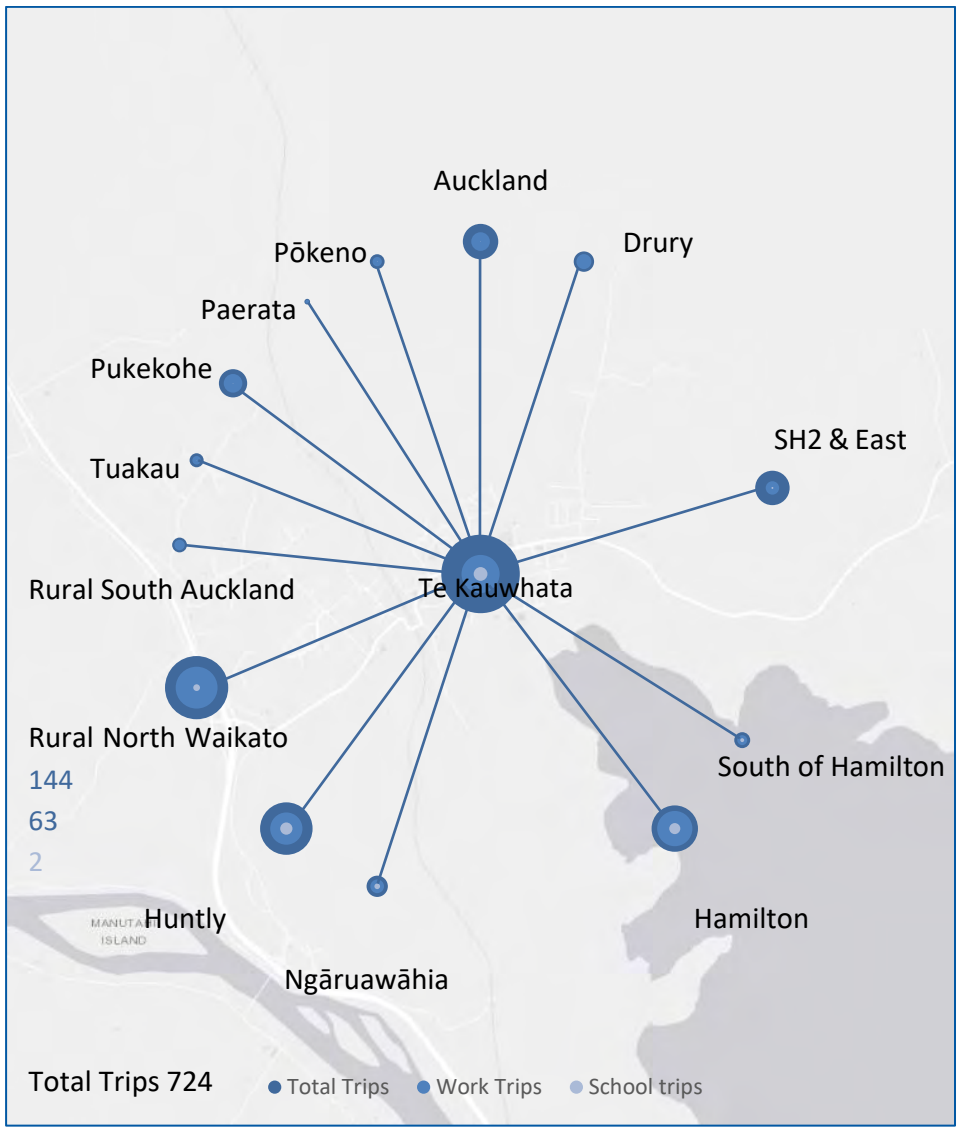

Currently, almost all of Pōkeno's trips to school are internal and trips to employment are to Auckland (refer to the census data in Figure 14 previously). Both the MSM and WRTM base models predict a more dispersed trip distribution. The forecast trip pattern in both models is predicted to be similarly dispersed. The MSM predicts substantial growth in trips to Auckland, Pukekohe and Tuakau – a result of the MSM's land use assumptions, which anticipate major population growth but little employment growth in Pōkeno. By contrast, the WRTM assumes greater employment growth in Pōkeno but less population growth than in MSM, and as a result, predicts more internal trips. Notably, almost all WRTM trips to Hamilton are predicted to be commute to work trips, with almost no trips to employment in Auckland. This seems an unlikely outcome, given existing commuting patterns and that Auckland is both closer and a larger employment destination than Hamilton. This may be due to the WRTM's geographical limitations.

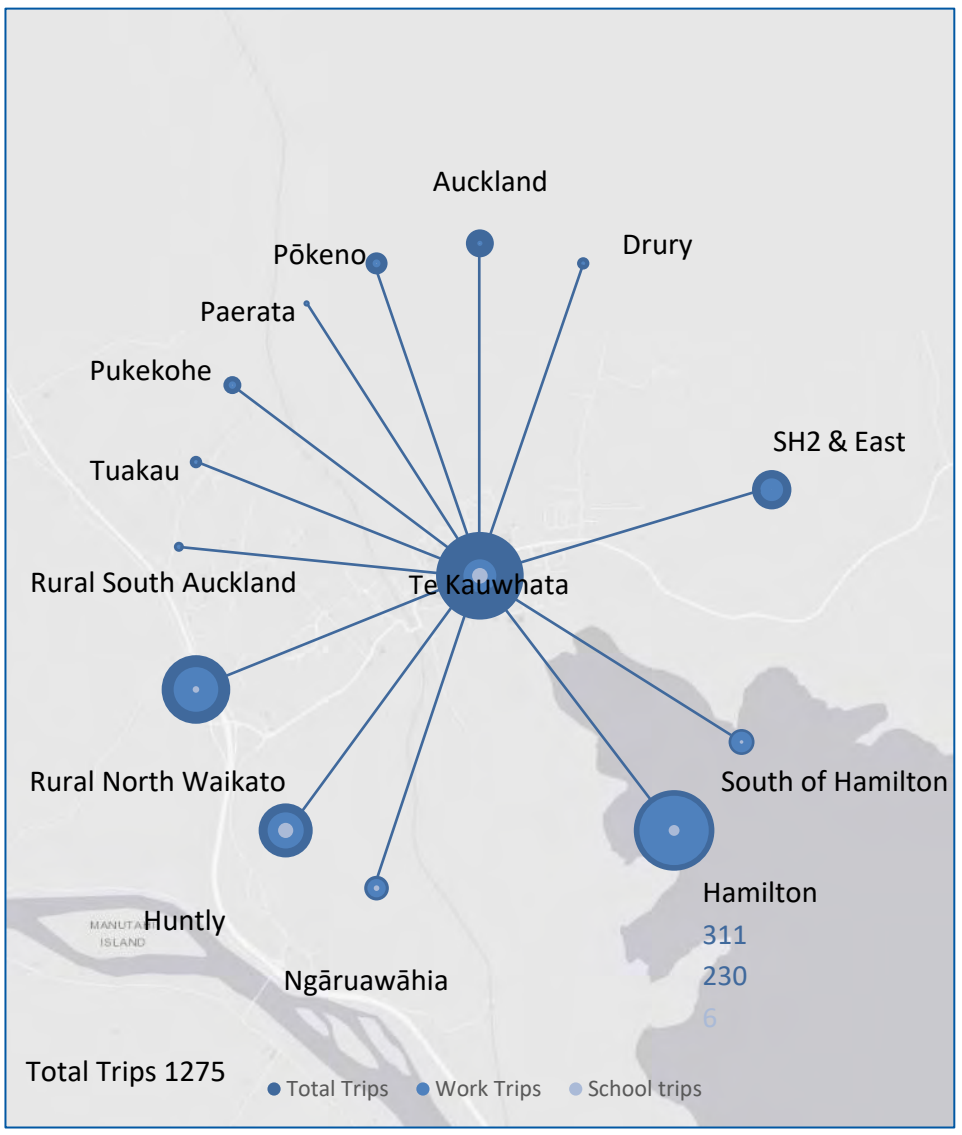

5.4 Te Kauwhata

Te Kauwhata not included in MSM

Figure 24: Morning peak period trips originating in Te Kauwhata in 2013 (top) and forecasted for 2051 (bottom) based on the WRTM

Te Kauwhata not included in MSM

Currently, almost all of Te Kauwhata's trips to school are internal, and almost all trips to employment are to rural areas (refer to the census data in Figure 15 previously). The WRTM base model broadly matches this, but also suggests trips to employment in Huntly and Hamilton. The WRTM also predicts that the majority of other trip types are internal within Te Kauwhata. This is a surprising outcome, given the small existing size of Te Kauwhata.

The WRTM predicts that Te Kauwhata's trip patterns will continue to be mostly internal and south facing to Hamilton, Huntly and to rural Waikato areas. Like Pōkeno, most trips to Hamilton are predicted to be commute to work trips.

6 POTENTIAL FOR MODE CHANGE

We are aware that the WRTM is a traffic model, not a multi modal model, and therefore corrections need to made to the traffic forecasts, both to reflect the updated land use forecasts set out in Section 3.3 above, and also to reflect the potential for mode change. This section of the report considers the potential for mode change. In addition, the model outputs are restricted to the morning peak, interpeak, and evening peak. Patterns during the morning and evening peaks are fairly similar, hence for the identified communities the morning peak period has been analysed.

6.1 Perceived cost of travel

Mode selection is a complex process based on a multitude of factors. These factors include availability of public transport services, car ownership, and the relative advantages of each mode depending on travel time, monetary cost, convenience, comfort, and safety. The perceived times and costs of travel are the main contributing factors for mode selection. This means that to facilitate mode shift from vehicles to active modes or public transport, the perceived time/cost of the latter must be lower.

However, the assessment of perceived times and costs is an extensive exercise and would normally be examined in a detailed study. Hence the following sections assume appropriate investment occurs to facilitate reductions in the perceived times and costs to encourage mode shift to walking, cycling and public transport. To assess the effects we have investigated similar regions in New Zealand with investment in alternative modes of travel. Given recent policy and planning documents commonality of prioritising mode shift, there is an expectation that mode shift is not only anticipated but compulsory to meet objectives of the Government Policy Statement and hence the Waikato Regional Land Transport Plan. This is further discussed in Section 6.6.

6.2 Appropriate investment to facilitate mode shift

For the purpose of this study, we have assumed appropriate investment to include:

- Walking and cycling networks that connect residential areas to key destinations, including schools, areas of employment, shops, parks and PT hubs, via safe, connected infrastructure. For example separated cycle infrastructure may be required on streets with either more than 3,000 vpd, or vehicle speeds over 30 km/h, plus traffic calming/low traffic neighbourhoods within residential areas, with safe pedestrian crossings throughout
- For North Waikato communities, it would also include a regional network connecting adjacent urban areas such as Pōkeno and Tuakau
- A PT network where door-to-door generalised cost of travel (include time, waiting, transfers and financial costs) is competitive with car travel.

6.3 The potential for active travel

People living in local communities will already be undertaking some trips by active modes, ie, on foot or by bike, within their neighbourhoods, but many trips are undertaken by car, as evidenced from the 2018 census data discussed below.

Within Tuakau, Pōkeno and Te Kauwhata, internal trips have the potential to be undertaken by active modes (walking, cycling and micro mobility) and this can be encouraged and enabled by appropriate infrastructure for these modes.

Some trips between Tuakau and Pōkeno, and between Tuakau and Pukekohe could be made by cycling/micro mobility, if appropriate facilities (as described in Section 6.2) are provided between these towns. These latter trips are in the order of 10 km each, which is longer than most people will consider cycling, but considered a realistic distance by e-bike or by other potential micro mobility devices.

Table 3 below summarises these morning peak period "short trips", to illustrate the potential for active mode travel.

Table 3: Morning peak period short trips in 2051 with potential to be by active mode

	Internal trips	Other short trips	Total short trips	Short trip proportion of all trips
Tuakau	573	Pukekohe: 830 Pōkeno: 262	1,666	59%
Pōkeno	838	Tuakau: 272	1,110	29%
Te Kauwhata	367	None	367	29%

The take up in active mode travel will be lower than the short trip proportions identified above, due to factors such as

- Trip types, with vehicles needed for certain trip types to carry goods and people
- Trip lengths, with the shortest trips having potential to be by foot and other short trips having potential to be cycled
- An individual's level of mobility, access to a bike and societal norms around cycling, among other factors.

Nonetheless, the above short trips provide a useful indicator that there will be potential for increased active mode trips within and between the three towns, encouraged and enabled by appropriate infrastructure and, most importantly, provided that sufficient schools, jobs, local centre shops/ amenities and recreational opportunities supporting the local community's needs are located within these towns.

In the 2018 census, 3% of commute to work trips from Tuakau, Pōkeno and Te Kauwhata were on foot, while 0.3% of these trips were by bike. By contrast:

- A 7% cycle to work mode share was recorded in Nelson, and 6% in Christchurch, both cities that have invested in cycle infrastructure in the years prior

- Within both cities, cycle mode shares between 10% and 17% were recorded in census area units with better (but still incomplete) cycle networks
- Nationally, 6% of commute trips were by foot and 2.2% by bike, with much higher walking mode shares in urbanised areas

With significant greenfield growth expected within Tuakau, Pōkeno and Te Kauwhata, there is the opportunity to provide walkable and cyclable communities with safe active mode infrastructure. If best practice active mode infrastructure is constructed, we consider active mode shares of 10% or more very achievable within all three towns, provided that schools, jobs, shops, community services/amenities and recreational opportunities are included along with housing development.

There is also the potential for first/last leg of public transport trips to be by active modes, if a network of active mode infrastructure and public transport services is provided. This will also help enable increased use of public transport, as it can be the difference between being able to safely get to and from public transport stops and stations without the need for a car (or second car).

The mode share figures set out above assume proportional investment into cycling infrastructure.

The purpose of analysing journey to work data for this section is based on the available Stats NZ data which provides mode share for journeys to work as a point of comparison.

We also note the mode share of 10% is an estimate based on the above comparisons. Although Nelson and Christchurch have higher proportions of local employment, both cities are also geographically much larger than the North Waikato towns, with longer commute trip lengths. So there are pluses and minuses, in arriving at the 10% estimate.

6.4 The potential for public transport

Existing public transport services[5] include:

- Hamilton-Te Kauwhata 21 Northern Connector
- Hamilton-Pukekohe (once per day) via Te Rapa, Ngaruawhia, Huntly, Te Kauwhata, Meremere, Pōkeno, Tuakau
- Pōkeno to Pukekohe 44 service, connecting to the rail station at Pukekohe
- Te Huia passenger rail service between Hamilton – Huntly - Papakura

Tuakau, Pōkeno and Te Kauwhata all lie on the North Island Main Trunk (NIMT) rail corridor, as do the other towns and cities considered in this study. While there are no existing passenger rail stations in many of these towns, there remains the potential to add them in the future. Also, Pōkeno and Te Kauwhata are close to SH1, opening the possibility for regional bus services to detour via these towns, either instead of rail connections, or before rail stations are provided.

[5] https://www.busit.co.nz/regional-services/Pōkeno-to-pukekohe/
https://www.busit.co.nz/regional-services/northern-connector/
https://www.tehuiatrain.co.nz/

Table 4 below summarises the morning peak period trips between towns that have the potential to be connected by public transport services.

Table 4: Morning peak period trips in 2051 with potential to be by public transport

	Trips to destinations potentially accessible by rail or bus		Total potential rail or bus trips	Potential rail or bus trip proportion of all trips
Tuakau	Drury: 94 Paerata: 63 Pukekohe: 830 Pōkeno: 262 Auckland: 260	Te Kauwhata: 24 Huntly: 38 Ngāruawāhia: 10 Hamilton: 138	1,720	61%
Pōkeno	Drury: 222 Paerata: 58 Pukekohe: 517 Tuakau: 272 Auckland: 585	Te Kauwhata: 58 Huntly: 87 Ngāruawāhia: 22 Hamilton: 295	2,120	56%
Te Kauwhata	Drury: 7 Paerata: 2 Pukekohe: 15 Tuakau: 7 Auckland: 37	Pōkeno: 23 Huntly: 140 Ngāruawāhia: 29 Hamilton: 311	370	45%

The existing public transport mode share for commute to work trips from Tuakau, Pōkeno and Te Kauwhata from the 2018 census is 3%. This is understandably low, given the limited public transport services to these towns currently.

An indicator of achievable public transport potential for these towns is the existing public transport mode share within the Greater Wellington Region, where rural towns are served by two regional rail lines. This is not dissimilar to the North Waikato towns, if reliable and frequent rail services were to be provided. Existing public transport journey to work mode shares within Greater Wellington are:

- On the Kāpiti line public transport mode shares are 19% from Paekākāriki (40 km to central Wellington), 16% from Paraparaumu and 17% from Waikanae (55 km to central Wellington)
- On the Wairarapa line public transport mode shares are 18% from Featherston (60 km to central Wellington), 15% from Greytown, 8% from Carterton, and 2% from Masterton (100 km from central Wellington)
- By comparison, Tuakau and Pōkeno are around 55 km from central Auckland and 70 km from Hamilton. Te Kauwhata is around 80 km from central Auckland and 50 km from Hamilton.

Distance is considered a more reasonable metric compared with travel time. as the latter is dependent on optimising the network. We can expect investment in PT to reduce travel times from origins within North Waikato, making it a more attractive mode compared to vehicle over time, particularly with

vehicle travel times likely to worsen given the expected increase in congestion as highlighted by Section 9.1.

As a comparison, it is known that over 50% of trips crossing the Auckland Harbour Bridge southbound in the morning peak period are by public transport. This is a result, to a significant extent, of the significant travel time advantage of buses using the Northern Busway, relative to the severe congestion in the adjacent traffic lanes, and also due to the level of car parking restraint within the Auckland CBD.

This North Auckland example may be of relevance to the North Waikato area, with severe congestion already apparent on the Southern Motorway, and with investment proposed in commuter rail from South Auckland (see below). However, it is apparent that the level of mode change is likely to be significantly different according to the ability of public transport to serve particular origins and destinations. That is to say, a 50% mode change may be possible for trips from an origin close to a rail station in North Waikato to a destination within the Auckland CBD (or other centres along the rail route, such as Newmarket). However, this is likely to be a fairly small proportion of all trips, and other trips with relatively less convenient public transport options are likely to have a smaller mode share.

Public transport mode shares for trips to work may be in the order of 20% or more, if appropriate rail services and stations or other forms of quality public transport are provided (see Section 6.2) that connect the North Waikato towns to employment areas in Auckland, Manukau and Hamilton. Integrating facilities for people walking and cycling to public transport stops and stations will help enable people to use public transport services. Overall, 15% public transport mode share for all trip types[6] could be achievable.

Without significant investment in public transport, it is reasonable to expect that the majority of the above trips would be by private car, as only those trips between Tuakau and Pukekohe and between Tuakau and Pōkeno would be realistic active mode trips, and that is only if facilities for cycling are provided.

6.5 Changes in Transport Provision

There is a range of transport projects that will change the multi modal provision of transport in the area.

6.5.1 Improvements to State Highway 1: Southern Motorway

As part of the NZTA's Southern Corridor Improvements (SCI) project, State Highway 1 through South Auckland has been widened to three lanes in each direction between Papakura and Hill Road, and to four southbound lanes from SH20 to Hill Road. Also, a fourth northbound lane is proposed from Hill Road to Manukau. This was consented but not constructed as part of the SCI project.

Construction has now started on the next phase of work on the Southern Motorway, from Papakura to Bombay. The works under construction are from Papakura to Drury, with works consented to south of

[6] Based on the NZ ratio of public transport mode share for trips to work (7.3%, census 2018) to that for all trip types (2.5%, Household Travel Survey 2015-18), and recognising that the Household Travel Survey mode share is low as it excludes public transport trips over 60km or 1 hour, and includes pedestrian legs of multimodal trips

Drury. Further works, from south of Drury to Bombay, have recently been removed from the Government's NZ Up programme, although presumably these works could still proceed at some time.

6.5.2 Improvements to State Highway 1: Waikato Expressway

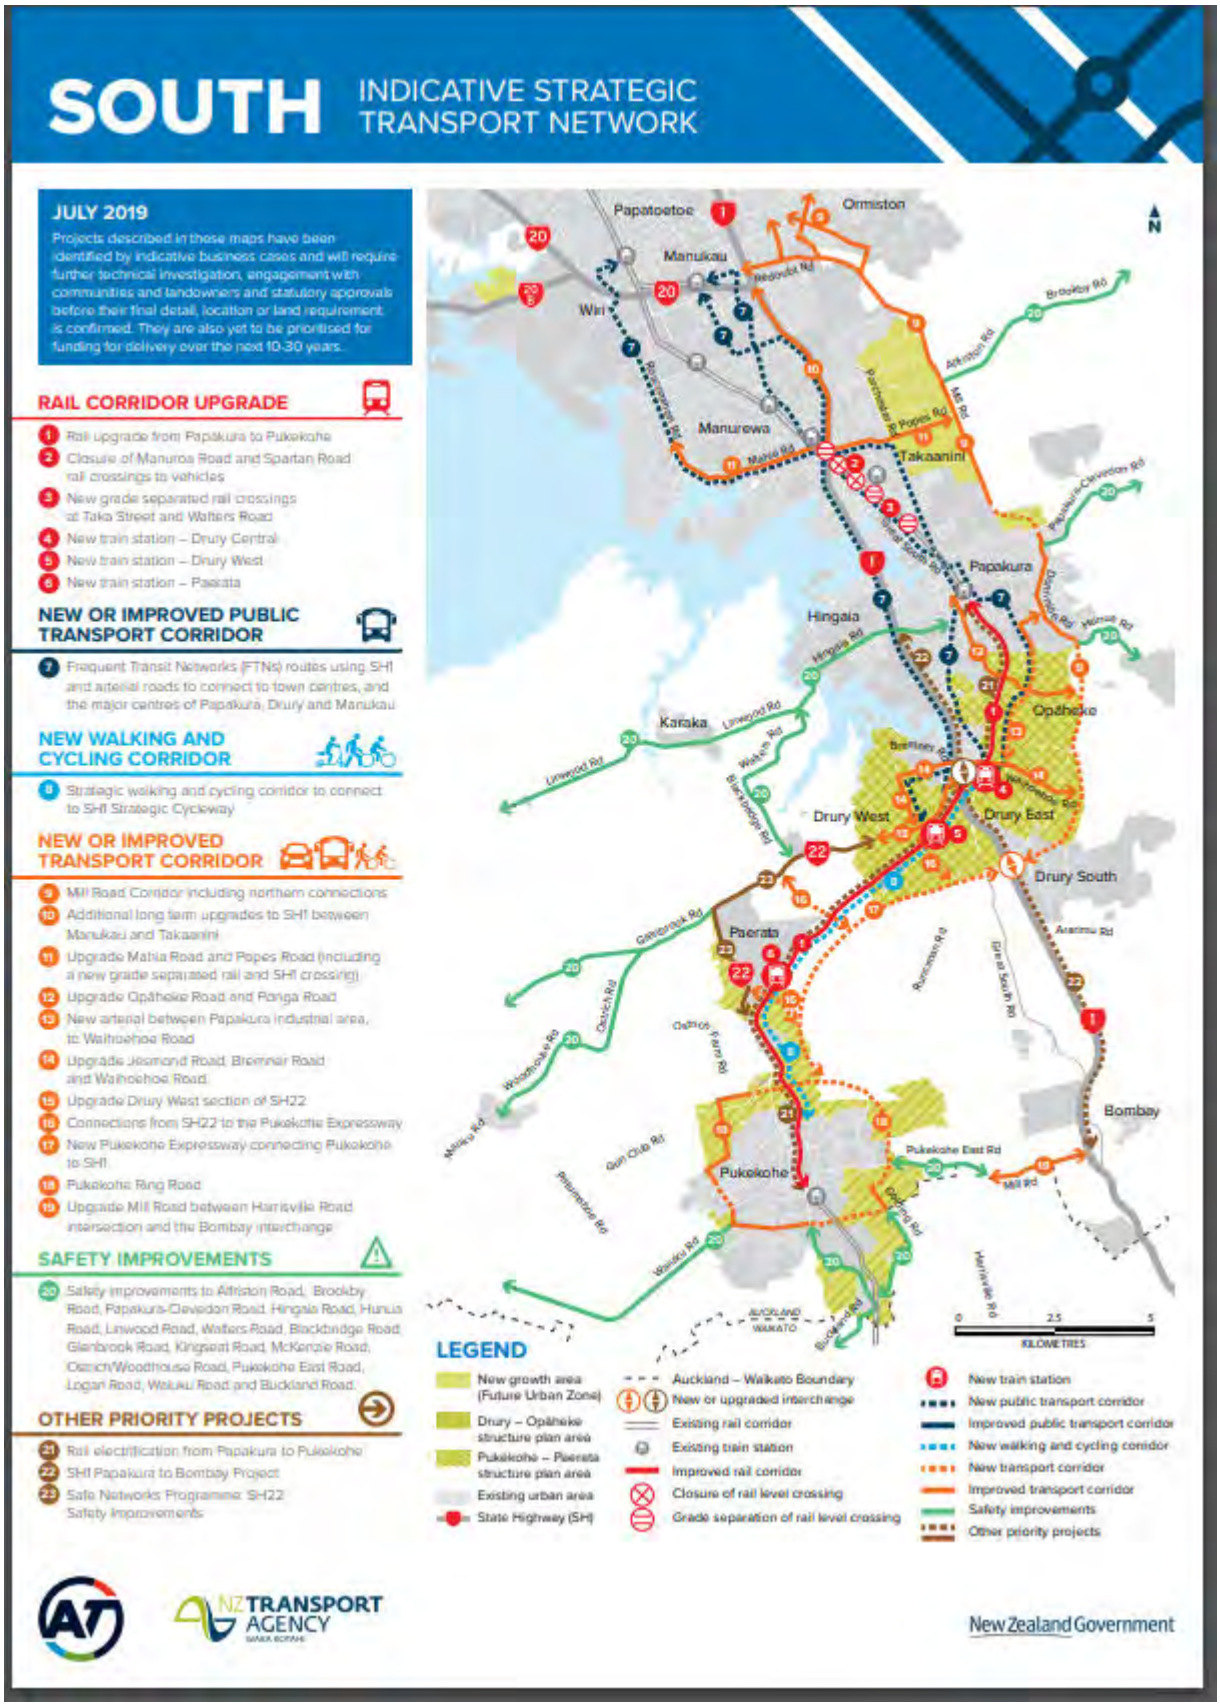

Significant progress has also been made to improve the Waikato Expressway. Improvements to sections as far south as Te Rapa have been completed, and the Hamilton Section is set to be completed in 2022.

While the northern sections of the Expressway are complete, further works may be required in due course, for the section of SH1 between Hampton Downs and Bombay in particular. Such improvements would include easing the alignment (to increase the design speed), the elimination of all right turns across the main carriageway from minor roads, elimination of private accesses, and provision for pedestrians and cyclists, in order to convert the route from "Expressway" to "Motorway" standard. This would require the development of a secondary road network, to accommodate the minor road and private access movements, and to provide for pedestrians and cyclists.

6.5.3 Supporting Growth

The North Waikato sits immediately south of the area considered by the southern area of Auckland's "Supporting Growth" project. The recommended network for South Auckland, as a result of that project, is shown below in Figure 25.

Figure 25: Auckland's Transport for Future Urban Growth: Southern Area

The projects of particular relevance to the North Waikato area are as follows:

- The development of a new north south corridor between Manukau, Drury and Pukekohe (item 9, Mill Road, and item 17, termed the "Pukekohe Expressway"). The Mill Road project was recently rescoped as part of the NZ Up project. It is now to be a smaller scale project, with a focus on addressing safety issues. It is expected to involve an upgrade of two lanes instead of four between Flat Bush and Alfriston tying in to the existing urban Redoubt Road dynamic lanes. There will also be targeted safety improvements between Alfriston and Papakura. It is conceivable that the southern sections (south of Papakura) may still progress at some stage, but clearly there is no commitment
- It will be noted that the above concepts only extend as far south as Pukekohe, although item 18 also refers to a Pukekohe Ring Road. However, item 20 refers to a number of safety improvements, including the connections to North Waikato
- Electrification of the southern rail line, from Papakura to Pukekohe (item 21), forms part of the Auckland Metro Rail Programme component of the NZ Up programme, and it is to be progressed in the short term
- Further investment in rail includes the removal of level crossings (items 2 and 3). In addition, the provision of an additional track, further to the north, forms part of the Auckland Metro Rail Programme component of the NZ Up package. This will provide the "step change" in capacity, allowing an increase in train frequencies, and the third track will allow the separation of passenger from freight trains
- Additional rail stations are proposed at Paerata, Drury and Drury West (items 4-6).

6.5.4 Public Transport

There has been strong community interest in rail for some time, with interest in commuter rail services through North Waikato. The Te Huia train service from Hamilton to Auckland came into operation during early 2021, providing two northbound services in the morning and two southbound services in the afternoon. These stop at Huntly and terminate at Papakura, where passengers change onto the existing Auckland commuter rail services. This means that these services currently bypass North Waikato. Investigations are progressing into further inter city services.

In addition, a draft North Waikato public transport review was carried out by Waikato Regional Council (and others), which considered the need for improvements to public transport in the North Waikato. Indeed, that study concluded that "improving public transport is key for the connectivity and growth of these towns", and the draft recommendations of the study (i.e. these proposals may not yet be committed) are as follows[7]:

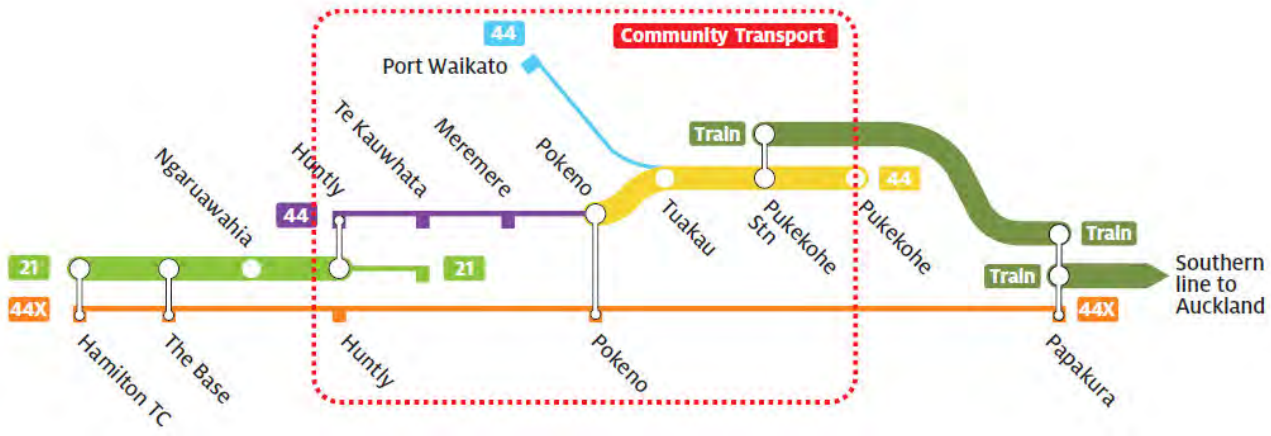

- Pōkeno to Pukekohe, via Tuakau: This service will provide key connections for Pōkeno and Tuakau residents to Pukekohe, both in peak and off peak times. This bus would replace the current Auckland Transport service between Tuakau and Pukekohe

[7] Waikato District Council and Waikato Regional Council (2016 or 2017 (Undated)), "North Waikato Public Transport Review – Draft for Discussion Only". We are unclear whether these is a subsequent update to this review

- Huntly to Pukekohe: This would extend an existing Northern Connector bus through to Pukekohe, once a day, in the off peak, Monday to Friday, providing middle of the day connectivity between Huntly, Rangiriri, Te Kauwhata, Merememe, Mercer, Pōkeno, Tuakau and Pukekohe
- Te Kauwhata to Hamilton: this would extend a current Northern Connector bus service to Te Kauwhata, for one return trips in the peak weekdays, providing access for Te Kauwhata residents to Huntly and Hamilton for school, tertiary education and work
- Hamilton to Papakura: this would be a new route designed to provide fast and direct commuter access between Hamilton and Auckland
- Port Waikato to Pukekohe: this would either retain the existing once a week Auckland Transport service, or it would replace the timetabled bus with a community transport option
- Community Transport: a North Waikato community transport scheme could operate in a similar fashion to the Community Vehicle Trusts in Canterbury. This would generally cater for elderly and less mobile residents as well as school groups, sports groups and all members of the community.

These potential services are shown in Figure 26 below and the regional future public transport network in Figure 27.

Figure 26: Potential North Waikato Public Transport Bus Services[8]

[8] Retrieved from North Waikato Public Transport Options Draft in October 2021https://fyi.org.nz/request/8494/response/27973/attach/3/Attachment%201%20NW%20options%20discussion%20paper%2018%20May%202017%20optimised%202.pdf

Figure 27: North Waikato Public Transport future public transport network concept[9]

6.6 Government direction and policy

The Climate Change Response (Zero Carbon) Amendment Bill[10] was passed in 2019. The bill sets a domestic greenhouse gas emissions reduction target for New Zealand to reduce net emissions of all greenhouse gases (except biogenic methane) to zero by 2050.

In response to the Zero Carbon bill, the He Pou a Rangi Climate Change Commission advised the Government in May 2021 on climate change action in New Zealand. That advice included the following recommendations to reduce transport emissions:

- Reducing the reliance on cars (or light vehicles), and supporting people to walk, cycle or use public transport
- Rapidly adopting electric vehicles
- Decarbonise heavy transport and freight, by moving more freight by sea and rail
- Encourage an urban form that minimises the need to travel long distances

The Government Policy Statement on Land Transport (GPS) sets out the government's transport investment priorities over the 2021-31 period. The GPS is the government's main lever to ensure investment in land transport by Waka Kotahi and local government reflects government priorities. The government's commitments make it clear that transformation of the land transport system is a priority.

[9] Retrieved from Waikato Regional Public Transport Plan 2018-2028 *Mahere Hukihuki Waka Tūmatanui Ā Rohe O Waikato 2018-2028* in October 2021 https://www.waikatoregion.govt.nz/assets/WRC/Council/Policy-and-Plans/Transport/RPTP/DRAFT-RPTP-2018-2028.pdf
[10] https://www.legislation.govt.nz/act/public/2019/0061/latest/LMS183736.html

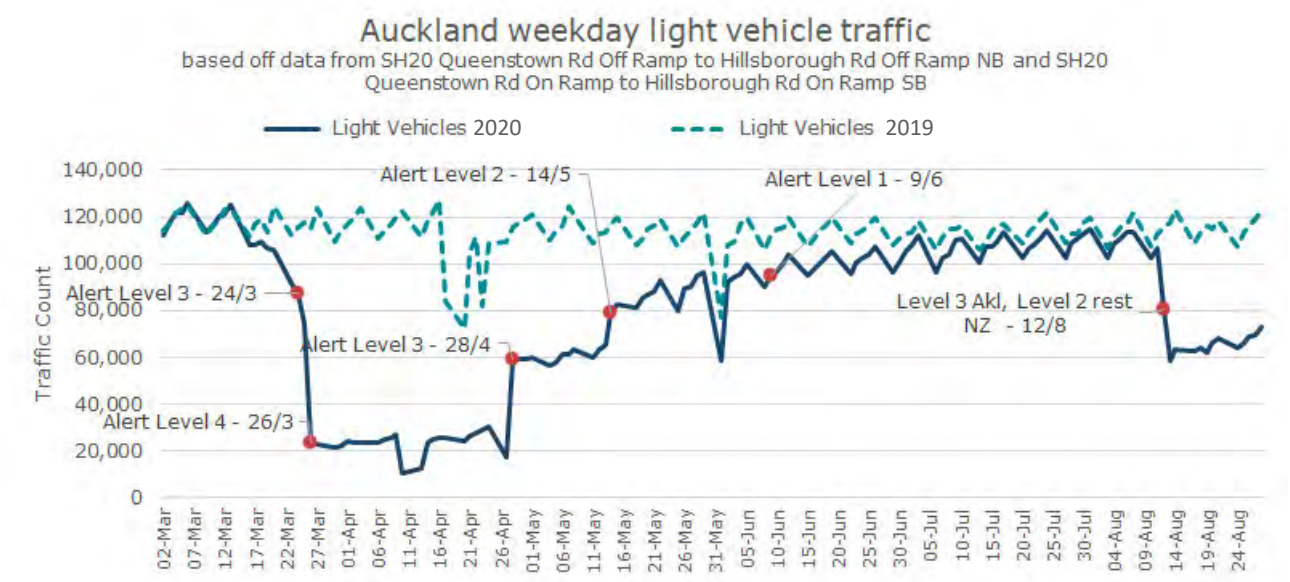

The GPS 2021 prioritises four strategic outcomes relating to safety, better transport options, improving freight connections, and climate change.

6.7 The potential for reducing trips

New Zealand witnessed a change in travel behaviour because of Covid-19 restrictions, with a number of people still working from home some or all of the time.

Data indicates that Auckland traffic in August 2020 was 61.4% of traffic at the same time in 2019, and when compared to the previous week there was a 5.7% increase in light traffic and a 4.5% increase for heavy traffic.[11] However, Auckland was at Alert Level 3 at this time and the rest of NZ was at Alert Level 2.

Figure 28: Influence of Alert Levels on Auckland Weekday light vehicle traffic

Other cities, including Wellington, Christchurch and Dunedin had returned to similar traffic levels.

While some people can choose to work from home and therefore reduce trips on the road, unless there is an incentive to do so, or a disincentive to travel, then the numbers of people working at home by choice might not result in a meaningful reduction in traffic during peak times, albeit it may result in a slight reduction of the peak duration.

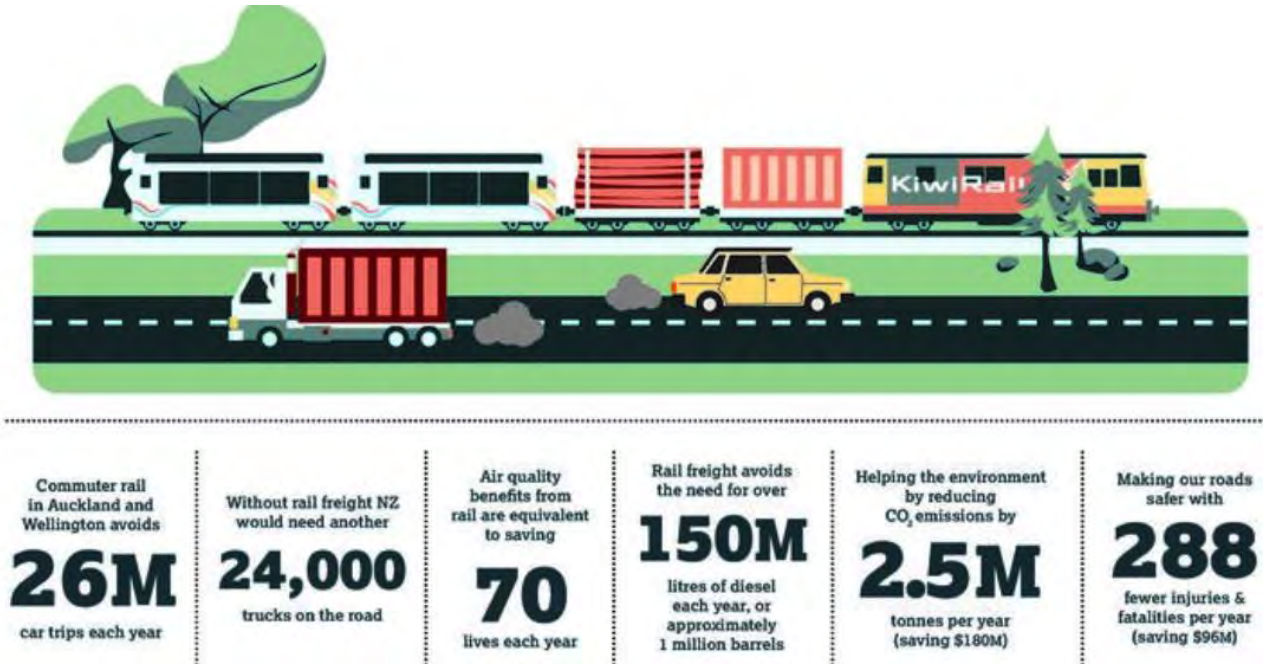

6.8 The potential for freight travel to change to rail or coastal shipping

The government's NZ Rail Plan[12] identifies that by 2052 freight tonnage in NZ is expected to increase by almost 40%. Significant investment is highlighted, with investments including double tracking Auckland to Hamilton and upgrading tracks to allow more weight to be carried across much of the country. Additional electrification could be installed on heavily used routes.

[11] https://www.nzta.govt.nz/about-us/coronavirus-disease-covid-19-services-update/data-and-research/weekly-traffic-count-information/

[12] https://www.transport.govt.nz/area-of-interest/infrastructure-and-investment/the-new-zealand-rail-plan/

Figure 29: The potential effect of investment into freight mode shift

Increased coastal shipping would help to reduce freight carried by road. Currently ships carry freight and bulk cargoes (eg oil, cement, fertiliser) along the New Zealand coast and between the North and South Islands. The NZ Shipping Federation states[13] that it is estimated that 15% of New Zealand's inter-regional freight is carried by sea and that shipping is a critical component of our domestic transport network. By comparison, in Japan, a country with a similar geography, more than 30% of freight is carried by sea.

As the MSM and WRTM were developed prior to the focus on a more mode-neutral transport investment process, it could be reasonable to assume that there could be less road based freight than is predicted in the models. We have therefore carried out as sensitivity test on the traffic forecasts in Section 9 below, which assumes higher quantities of freight trips are moved by rail or shipping.

6.9 Community Attitudes to Existing Travel Issues

Household travel surveys were undertaken in July 2016[14]. The main feedback from the community to the surveys was as follows:

- There is a lack of public transport in the North Waikato area. This was identified by 42% of respondents as being the main transport challenge for their household
- People in these communities have limited transport choices. 10% of respondents had limited or no access to private cars, due to disabilities or age
- There is a willingness to use public transport if available. 63% of respondents stated they were likely to use public transport for shopping or leisure purposes, 55% for health services and 48% for work related trips, if public transport was available

[13] https://nzsf.org.nz/about-shipping-in-new-zealand
[14] We are not aware of any more recent surveys

- There is a strong community interest in passenger rail. Rail related issues were identified by 24% of respondents.
- 58% of persons responding from Pōkeno indicated that they would use a bus for travel to Auckland, if it was available
- Traffic congestion was named as the main transport challenge by 13% of respondents.

7 CONSIDERATIONS FOR TRANSPORT INVESTMENT IN NORTH WAIKATO

7.1 Walking and Cycling

The nature of walking and cycling networks will depend on the actual location of areas to be zoned for additional residential use, and the key connections that will need to be provided to serve those areas. The emphasis of this study is on land use changes which lead to the provision of additional local services. These land use changes will significantly increase the potential for increases in walking and cycling trips, within the North Waikato townships, and investment will be required **within** those townships to improve the likelihood of trips by these modes.

However, while the majority of walking and cycling trips are likely to be short distance trips, within townships, we note that key walking/cycling issues for longer distance trips include:

- The likely need for future walking/cycling connections at Pokeno, across SH1
- The likely need for future walking/cycling connections between Pokeno and Tuakau. This may be required to support students in particular, if there is only a high school in Tuakau and not Pokeno
- The likely need for future connections between Tuakau and Pukekohe and between Huntly and Te Kauwhata
- The likely need for future walking/cycling connections which remove all active mode trips away from SH1 (either along or across the State Highway). This will change from "very desirable" to "essential" if the State Highway is upgraded from an Expressway to a Motorway.

7.2 Public Transport

The key considerations relating to public transport affecting North Waikato include

- The destinations of trips, for people from North Waikato, noting that according to the travel survey, a relatively small proportion of all household trips is currently heading to Pukekohe (16%), and a greater proportion is heading to Auckland (47%)
- Electrification of the southern rail line as far south as Pukekohe and the provision of additional rail tracks, further north[15]
- Future stations at Drury/Drury West
- The future of possible further extensions of passenger rail, to Tuakau and Pokeno

[15] Funding is now committed as part of the Government's New Zealand Upgrade Programme

- Inclusion of a third main line on the NIMT to segregate freight and passenger rail, facilitating improved travel times, frequencies and services to North Waikato communities
- The completion and effect of the City Rail Link on improved travel times, frequency and services to North Waikato communities
- The extent to which public transport for the North Waikato should rely on bus rather than rail, given the relatively low, and dispersed population
- There may be benefit in providing bus priority measures, where general traffic congestion is encountered on a regular basis. For example, if bus services are provided from Pokeno to Papakura rail station, in the short term, then bus shoulder lanes could be provided along SH1, from around Drury to the Papakura interchange (see Figure 29)
- Clearly, improvements in local bus services and bus infrastructure (i.e. bus stops/shelters) will be required in the short to medium term, to meet the expected demand, and the proposals of the North Waikato Public Transport Review are identified in Section 6.5.4 above.

If passenger rail services to the North Waikato are unlikely in the short term (and maybe the medium term), then investment in public transport for trips between North Waikato and Auckland may include

- Supporting trips transferring to rail or bus, at Pukekohe (shown in black in Figure 30)
- Supporting trips transferring to rail further north, eg at Drury West. This could include park and ride at Drury/Drury West and/or bus services from Tuakau or Pokeno to Drury/Drury West (shown in red and blue in Figure 30, for Tuakau and Pokeno, respectively).

Figure 30: Public Transport Options (assuming rail passenger transport does not extend south of Pukekohe)

8 MANUAL ADJUSTMENTS MADE TO MODEL OUTPUTS

Following consultation with the Auckland Forecasting Centre and Waikato District Council particularly highlighting the edge of model effects, in conjunction with new land use forecasts, it was determined that for this study to proceed, manual manipulation of the trip matrices is appropriate.

We have made adjustments in two parts, firstly to update the WRTM trip distribution based on higher land use forecasts and secondly to include the potential effects of mode shift.

Mode shift to active modes is likely to reduce vehicle trips predominantly on the local road network. Hence to reduce vehicle demands on the State Highway network from increased active mode choice, land use changes that encourage greater trips within communities are required.

On the other hand, investment in public transport is more likely to facilitate reduction of longer distance vehicle trips on the State Highway network.

8.1 Adjustments based on land use forecasts

As highlighted in section 3.3, there are differences between the MSM, WRTM, and NIDEA land use forecasts. This has implications on predicted traffic volumes particularly on the State Highway network as discussed in section 9.1.

We have adjusted the WRTM model forecasts to converge with the MSM and NIDEA land use forecasts. To be conservative, we have assessed the higher forecast scenarios as previous high population forecasts for the Waikato District are often exceeded[16].

We have factored trip origins based on the absolute difference between population forecasts. For example, NIDEA forecasts around 2.3 times more growth in Pōkeno in 2051 compared to the WRTM, hence the trips have been factored proportionally. Trip ends have been factored based on the employment trend differences.

The annual daily traffic in these locations have been determined by factoring the 2 hour morning, evening and peak hour volumes from the WRTM, with relevant factors determined from local observed traffic flows. This enables analysis of average daily traffic flows rather than peak hour traffic.

This method has been validated by comparing the total trip increase to the total population difference.

Details regarding the methodology and assumptions are set out in Appendix B.

8.2 Adjustments based on mode shift

We have considered three scenarios to assess the effects of people changing the way they travel:

- Scenario 1 – a is a do minimum scenario where we expect travel mode proportions to remain consistent with the WRTM distribution, incorporating the new land use factors
- Scenario 2 – assumes that investment is made in public transport services and infrastructure, and in active mode infrastructure that will enable and encourage a greater adoption of public transport use by people living and working within the north Waikato study area. This scenario anticipates a mode shift away from regional car trips of 15%
- Scenario 3 – as per scenario 2 with additional investment to enable/encourage a greater reduction (25%) in regional car trips

The effects on traffic forecasts are discussed in Section 9.

[16] http://www.creatingfutures.org.nz/assets/Projections-Comparisons-finalOct2020.pdf

A fourth scenario, assuming a mode change in freight, is set out below.

8.3 Adjustments based on greater freight trips by rail

As noted in Section 6.8, the base traffic forecasts assume a continuation of current trends in terms of freight trips being predominantly carried by road, and there is high probability that this may change over time. The precise proportions of freight trips that may divert to rail will depend on numerous factors, including the nature of the freight goods, the location or origins and destinations (and proximity to rail facilities), the level of investment in rail and rail hubs, changes in policy and views in response to climate change and other environmental issues, and so on.

As such, we have provided a sensitivity test to the determine the effect of an increase in freight trips via rail on the State Highway traffic volumes. The existing heavy commercial vehicle composition is summarised below in Table 5 (refer to Figure 31 for location of data), with the expectation the existing HCV composition will remain similar for the future base scenario. The sensitivity test considers investment in rail that reduces the forecast HCV volumes by 50%.

Table 5: Existing HCV composition of key locations as described in section 9.1

Location	HCV% existing
SH1 north	13%
Mill Road	9%
SH2	12%
SH1 south	13%

9 FUTURE TRANSPORT CONDITIONS

Section 4 provided a brief description of the existing transport situation. This section considers how this situation is likely to change as a result of the future land use (identified within Section 3) and transport changes (identified within Sections 6 and 7).

9.1 Forecast State Highway traffic volumes

One of the key questions for this study relates to forecast traffic flows in the North Waikato District, and how further land use change will affect the current forecasts.

Current forecasts have been derived from WRTM, and as set out in Sections 5 and earlier in Section 6. We have considered how these forecasts may be affected by the following:

- A greater level of land use change than currently anticipated at the time that the WRTM forecasts were developed
- The potential effects of greater trips by active modes
- The potential effects of greater trips by public transport
- The effects of investment in transport, noting that this will clearly affect the likelihood of the above changes in active modes and public transport

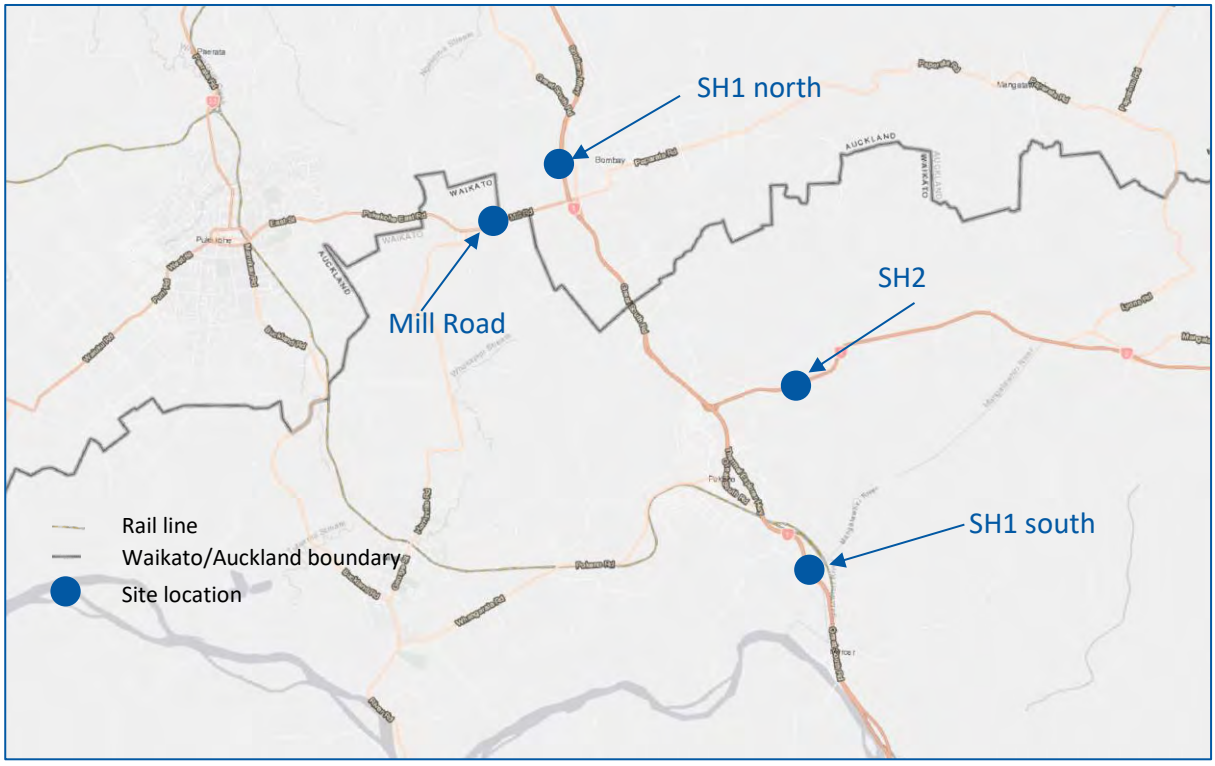

- The effects of greater proportions of freight being taken by rail (or coastal shipping).

The trips have then been aggregated based on likely routes from origins to destinations to determine the traffic volumes in key locations on the North Waikato/South Auckland portions of the State Highway network. The locations of traffic flows are:

- State Highway 1, north of the Bombay interchange
- Mill Road, west of the SH1 Bombay interchange
- SH2, east of the SH1 Pōkeno interchange
- SH1, south of Pōkeno.

The locations are indicated in Figure 31.

Figure 31: Indicative location of key traffic volumes on the State Highway network

The resulting forecasts are set out in Table 6 below.

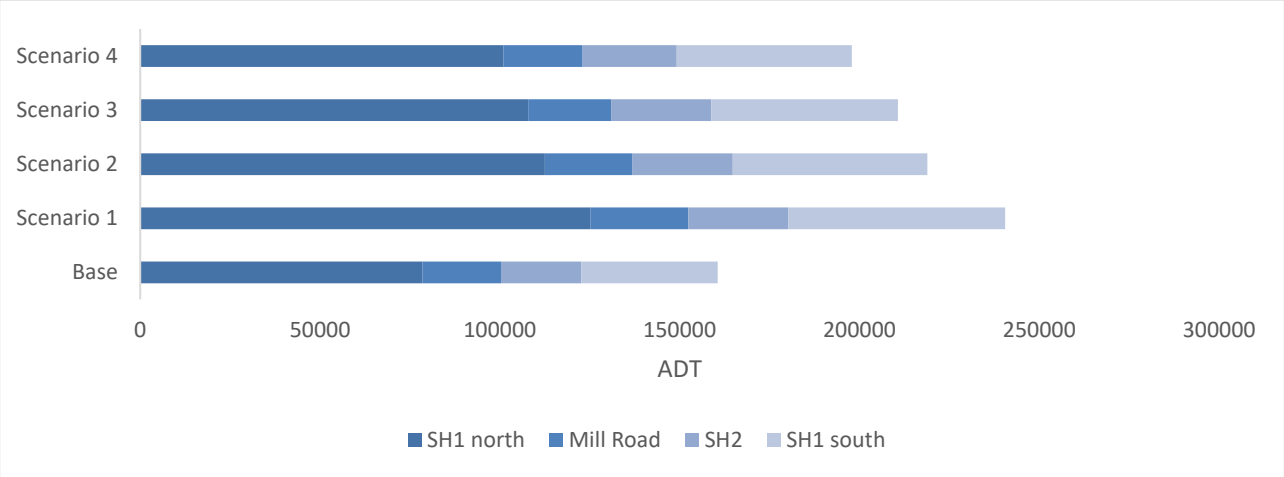

Table 6: 2051 forecast vehicle volumes of the State Highway network

	SH1 North	Mill Road	SH2	SH1 South
Base – WRTM unfactored output	78,500	21,800	22,300	38,000
Scenario 1 – WRTM land use updated	125,300	27,100	27,900	60,300
Scenario 2 – 15% mode shift	112,500	24,400	27,900	54,100
Scenario 3 – 25% mode shift	107,900	23,100	27,900	51,900
Scenario 4 – Scenario 3 plus 50% freight shift to rail	101,100	22,000	26,100	48,700

The forecast increases with Scenario 1 are clearly quite substantial, but these increases are in line with the increased population noted within Section 3.3.

Given the simplistic/speculative approach to updating the land use, we have supplied additional tests relating to the update factors in Appendix B.

Figure 32: ADT of key locations in each scenario

9.1.1 Local implications

From the above outputs we note that,

- The updated land use scenario increases the forecast flows substantially
- Scenarios 2 and 3 are predicted to reduce traffic flows (relative to Scenario 1), but substantial increases are still predicted. Greater reductions could be achieved if land use change leads to greater proportions of internal trips within townships
- Scenario 4 shows a marginal further reduction in traffic flows (relative to Scenario 3) due to freight mode shift. However the implications based on vehicle totals will have under-represented the effects on the network, hence section 9.1.3 below explores the changes in terms of passenger car equivalents.

9.1.2 Wider network implications

The above section indicated a maximum daily flow of around 60,000 vehicles/day on SH1, south of Pokeno, and this is within the capacity of a four lane highway. However, the forecast flows of 106,000 to 131,000 vehicles/day on SH1 north of Bombay are exceptionally high for a four lane road[17], and as set out within Section 7, widening of SH1 between the Drury and Bombay interchanges is **not** now proposed as part of the NZ Up package.

In order to consider the future operation of the Southern Motorway, we have taken forecasts from the SH1 Papakura to Drury Stage 1 study, which include the following AADT forecasts for 2038.

[17] As a comparison, the section of the Southern Motorway, between Papakura and Takanini, took daily flows of around 75,000 vehicles/day in 2013, prior to the works commencing to widen this section from two lanes per direction to three

Table 7: 2038 forecast vehicle volumes of the State Highway network north of the study area

SH1 section	AADT (vpd)	HCV (vpd)	HCV (%)
Takaanini to Papakura	137,800	15,500	11.2%
Papakura to Drury	111,600	12,700	11.4%
Drury to Drury South	86,700	10,300	11.9%
Drury South to Ramarama	87,200	9,500	10.9%
Ramarama to Bombay	84,600	10,300	12.1%
South of Bombay	74,300	9,400	12.7%

We note that the 2038 flows predict a similar volume as the original WRTM 2051 forecast. Hence we have added the difference of the forecasts for each scenario to produce Table 8.

Table 8: Combined 2038 and 2051 forecast vehicle volumes of the State Highway network north of the study area

	Takaanini to Papakura	Papakura to Drury	Drury to Drury South	Drury South to Ramarama	Ramarama to Bombay	South of Bombay
Scenario 1	188,800	162,600	137,700	138,200	135,600	125,300
Scenario 2	176,000	149,800	124,900	125,400	122,800	112,500
Scenario 3	171,400	145,200	120,300	120,800	118,200	107,900
Scenario 4	164,600	138,400	113,500	114,000	111,400	101,100

The above figures may be artificial demands. In reality the main bottlenecks along the corridor are north of Takaanini, and for example, northbound queues back from the congested sections would be extensive for much of the day with such high flows. As such, greater mode change, or greater change in travel behaviour (such as shortening of home to work trips or greater levels of internal trips within the townships) will be necessary.

9.1.3 The effect of Scenario 4 in passenger car equivalents

The section above noted that the forecast effects of Scenario 4, relative to Scenario 3, may be under-represented. We have rerun the numbers assuming all HCVs are three passenger car units (PCUs), leading to the following forecasts.

Table 9: 2051 forecast vehicle volumes of the State Highway network in pcu

	SH1 north	Mill Road	SH2	SH1 south
Scenario 1 – WRTM land use corrected	156,800	32,200	34,700	72,400
Scenario 2 – 15% mode shift	140,900	28,900	34,700	67,600
Scenario 3 – 25% mode shift	135,000	27,400	34,700	64,900
Scenario 4 – 50% freight shift to rail	113,800	24,000	29,400	54,800

The above table indicates that Scenario 4 will reduce the PCUs on the Southern Motorway, north of Bombay, by around 15%, relative to Scenario 3.

9.2 Freight

Section 6.8 highlighted the high volumes of heavy vehicles currently using the main roads in the North Waikato, including over 10% on SH1. The National Freight Demands Study undertaken in 2014 suggests that freight demands are projected to increase by 58% for road and 51% for rail over the next 30 years. The biggest increase is expected to be in and around Auckland, but the Waikato and Bay of Plenty regions are also expected to see significant growth. This not only confirms the amount of commercial activity in this area, but also highlights further demand that will be placed on the land transport system. However, clearly the relative proportions of increases in freight by road or rail will depend to a significant degree on the levels and types of transport investment.

9.3 Influence of key communities on State Highway traffic volumes

The following figures illustrate the broad origin and destinations of traffic in the key locations as described in Section 9.1. The figures indicate that the growth in Pokeno is likely to have the greatest impact on the State Highway network. The trend in traffic growth to and from Pokeno resembles substantial growth compared to the other communities which have a more gradual growth. The growth is likely to affect the distribution of traffic north of Bombay. For example, given the likely congestion along the SH1 north location, trips generated in Pukekohe are more likely to use SH22 to access SH1. However, given the coarse approach to this study, the figures are indicative only and a detailed approach will be necessary to determine the effects upstream of the study area. For each of the highlighted communities, we note that:

- Pukekohe is consistent between Scenarios, given no land use update has been applied
- Modest growth is expected from Tuakau, between the 2013 base and 2051 forecast. The update factor applied increases the trips marginally
- Pokeno in 2013 has around 5,000 daily trips towards Auckland, whereas the WRTM 2051 forecast is around 32,000. Subsequently, given the high land use adjustment indicated for Pokeno, Scenario 1 has around 71,000. We suggest that caution should be applied to this figure, as it may result from over-extrapolating from a low (2013) base, with significant land use change assumed within the higher land use update
- Modest growth is expected from Te Kauwhata. Overall although the trend is a reduction, which may be a result of a forecast trip distribution gravitating more to the south.

Figure 33: Origin and destination of traffic in key State Highway locations in 2013

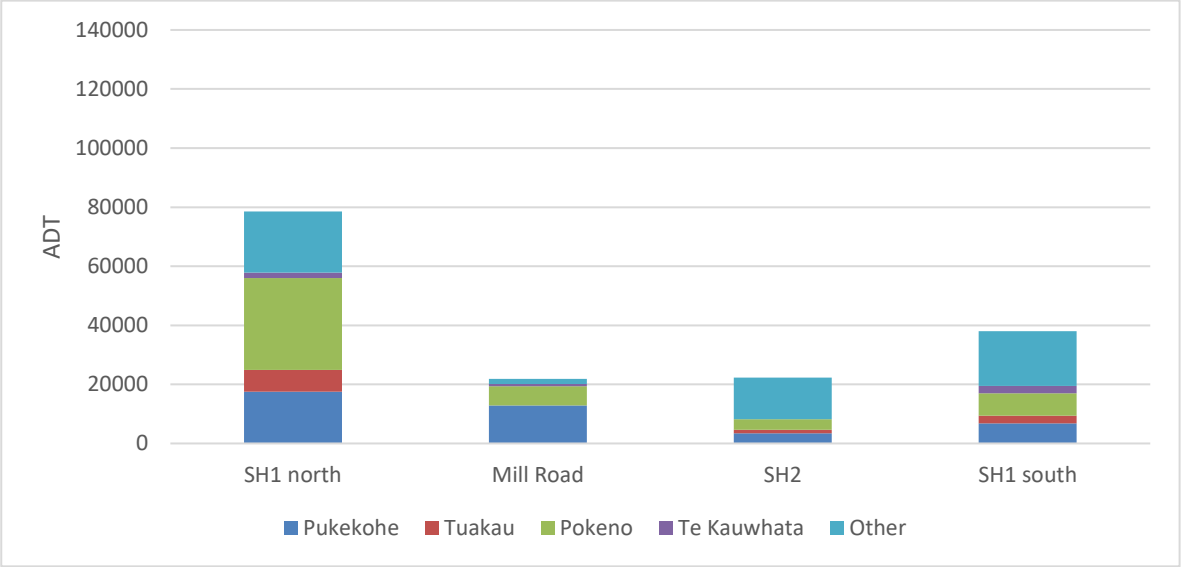

Figure 35: Origin and destination of traffic in key State Highway locations in forecast year, Scenario 1

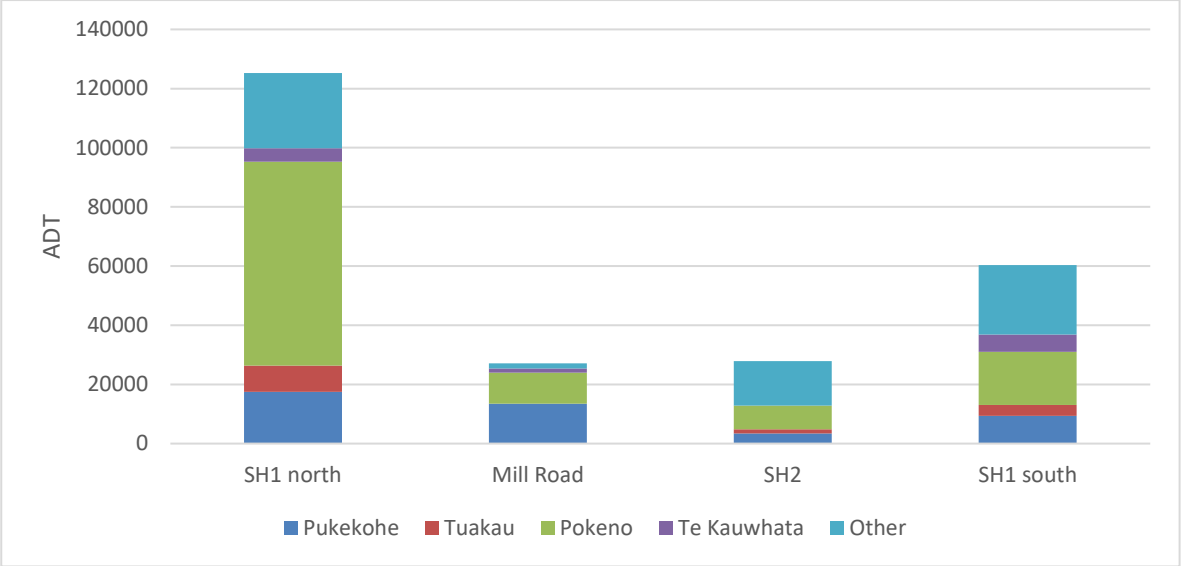

Figure 36: Origin and destination of traffic in key State Highway locations in forecast year, Scenario 2

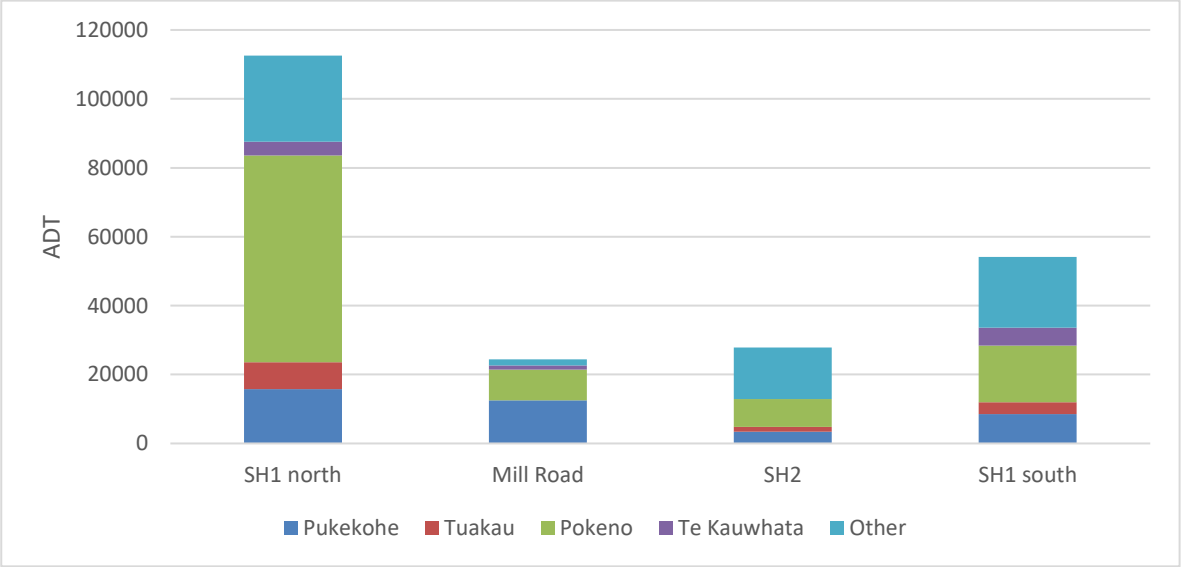

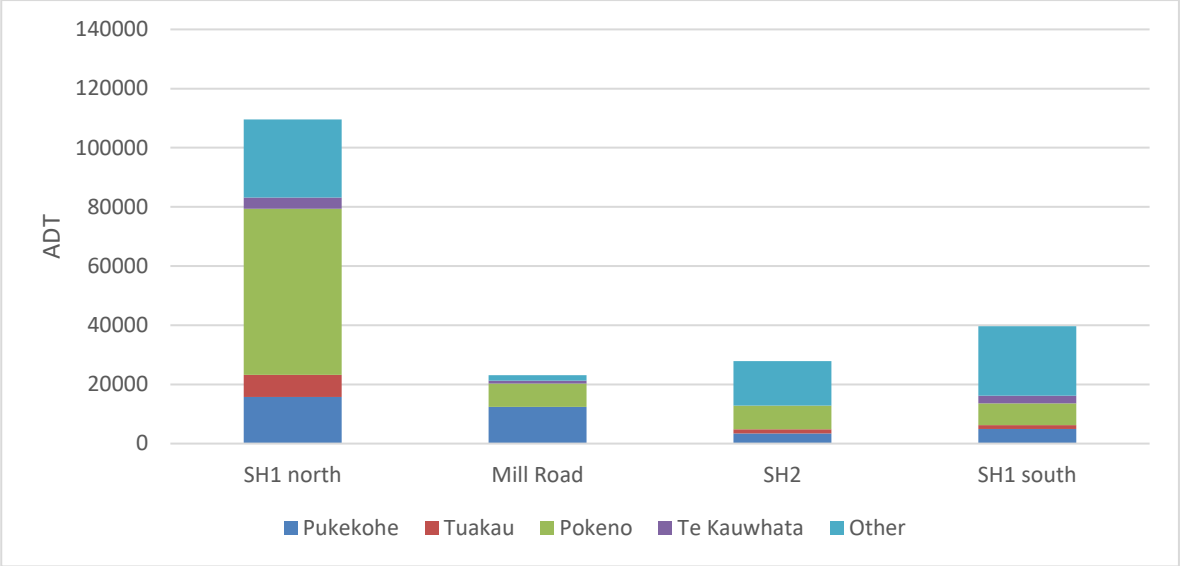

Figure 37: Origin and destination of traffic in key State Highway locations in forecast year, Scenario 3

9.4 Public Transport

Section 6.4 noted that the existing public transport journey to work mode shares for Tuakau, Pokeno and Huntly, according to the 2013 Census data, were 2%, 1% and 1%, respectively. These are clearly very low, reflecting the low existing public transport provision. These figures compare with centres to the north, according to the 2018 Census, as follows:

- 2% at Pukekohe, where bus services are provided, and where there is a train connection to Papakura
- 6% at Papakura, where there are bus services and electric rail services to the north.

Section 6.4 also suggested that public transport mode shares for trips to work may be in the order of 20% or more, but only if appropriate rail services and stations or other forms of quality public transport are provided (see Section 6.2) that connect the North Waikato towns to employment areas in Auckland, Manukau and Hamilton. Integrating facilities for people walking and cycling to public transport stops and stations will help enable people to use public transport services. Overall, 15% public transport mode share for all trip types could be achievable, with appropriate investment.

It should be stressed that the above figures are **not** intended to imply that mode share targets should be set. Rather, the intention should be to increase the number of trips per household by modes of transport other than the private car.

APPENDIX A forecast land uses

Table A 1: Household forecasts

Area	Source	Base	Long term forecast		
		2018	2048	2051	2070
Drury West & Hingaia	MSM	1,550	9,500		
	WRTM	450		11,100

APPENDIX B derivation of traffic flows based on updated land uses and mode shift

Assumptions relating to manual adjustment of trip matrices

The following section outlines the methodology to incorporate the updated land use forecasts. Each production has been factored based on the difference in population forecasts and each attraction has been factored based on the difference in employment.

To ensure this method is valid, the total factored trips have been compared to the total population forecast and manual adjustments have been applied where the total population is exceeded.

The trend illustrated in the WRTM trip distribution is that households north of and including Pōkeno tend to gravitate towards Auckland, while households south of Te Kauwhata gravitate more towards Hamilton.

Hence the adjustments made are reflective of this trend in addition to the discrepancies between the WRTM to the MSM and NIDEA land use forecasts.

Trip productions have been factored by the absolute population forecast difference whereas the attractions have been factored based on the relative trend difference between forecasts. The table below briefly explains the considerations of each origin and destination.

	As a production	As an attraction
Drury West	MSM and WRTM are relatively similar for Drury West	Significant increase in employment opportunities & extent of WRTM excludes east Drury compared to MSM
Paerata	MSM and WRTM are relatively similar for both Pukekohe and Paerata	Employment trend is similar
Pukekohe	MSM and WRTM are relatively similar for both Pukekohe and Paerata	Employment trend is similar
Tuakau	Tuakau has an approximate 10% higher forecast	Employment trend is similar
Pōkeno	Both WRTM and WISE model appear to converge although the 2070 forecast predicts a significantly higher population. The morning total peak hour trips expected in 2051 is 3770 (equal to the total number of employment opportunities), whereas the total population is some 16k (Waikato 2070) vs 5k (WRTM), an approximate 300% difference. From this we can determine an appropriate factor of up to 3 as an origin.	Employment trend is similar
Te Kauwhata	A significant difference in forecasted population, while the NIDEA forecast is similar to Waikato 2070. Hence a factor of around 2.5 has been applied.	Significant difference in employment however trend is in line with population hence minor change as attraction (mostly internal increase)
Huntly	The population forecasts vary significantly. The NIDEA trend is similar to Waikato 2070 whereas the WRTM	Employment growth shows a similar trend between the WRTM and WISE forecasts

	expects a reduction in population. A factor of around 2.9 has been applied.	
Ngaruawahia	The forecasts of all three predictions vary significantly. A factor of around 1.3 has been applied. It is noted that this community is likely to have a minor influence on the study area.	Similar employment trend with population

The WRTM outputs traffic flows in 2 hour peak periods. However average daily traffic (ADT) flows are more useful for our study. Hence the morning, evening an interpeak outputs from the WRTM have been factored up to ADT using the 2013 base compared to 2013 observed ADT from NZTA traffic counts. Table B 1 shows the 2 hour peak flow outputs from the WRTM, Table B 2 shows the factors determined by the volumes from Table B 3 to produce the forecast 2051 ADT.

The factors to determine the average daily traffic (ADT) are based on 2013 observed ADT from NZTA traffic counts. These counts are provided in the table below with a comparison to the WRTM 2013 base and 2051 forecast morning, evening, and interpeak 2 hour outputs. Locations 1 and 4 include one-way counts as the 2013 observed ADT is available for each direction whereas locations 2 and 3 have two way counts recorded.

Table B 1: Existing WRTM 2013 and 2051 forecast 2 hour peak traffic flows

		AM Peak Volume		INT Peak Volume		PM Peak Volume	
	Direction	**2013**	**2051**	**2013**	**2051**	**2013**	**2051**
1	NB	1820	2745	2240	4360	2660	5900
	SB	2510	5580	2360	4840	3860	5640
2	EB	1600	3130	1480	2700	1800	2270
	WB	2270	2870	1755	3135	2620	3310
3	EB	630	1730	550	825	770	675
	WB	600	430	615	1000	690	3410
4	NB	1110	3870	1330	2420	1830	4410
	SB	1150	1540	1290	2200	1710	2220

Table B 2: Peak hour to ADT factors determined from 2013 observed flows in Table B 3

	Direction	AM Factor	INT Factor	PM Factor
1	NB	0.67	7.6	0.67
	SB	0.67	7.6	0.67
2	EB/WB	0.25	3.20	0.25
3	EB/WB	0.67	10.2	0.67
4	NB	0.65	6.5	0.65
	SB	0.87	6.5	0.87

Table B 3: 2013 observed ADT used to determine factors in Table B 2 above producing WRTM ADT from peak hour flows

	Direction	Observed ADT 2013	WRTM ADT (2013)	Forecast ADT (2051)
1	NB	20,100	20,100	39,000
	SB	20,200	20,200	40,000
2	EB/WB	12,400	12,400	21,600
3	EB/WB	13,700	13,700	22,700
4	NB	10,500	10,500	21,100
	SB	10,900	10,900	17,600

Given the rudimentary analysis applied we have supplied additional tests relating to the updated factors based on the following,

- Reducing the higher forecast towns ie Huntly, Te Kauwhata and Pokeno to an upper limit of 2.5, 2.5, and 2, respectively, Table B 4
- Applying an upper maximum factor of 2 given we have used the highest forecast and not considered the medium or low forecasts, Table B 5.

Table B 4: 2051 forecast vehicle volumes of the State Highway network with reduced factors for Huntly, Te Kauwhata, and Pokeno

Scenario	SH1 north	Mill Road	SH2	SH1 south	Scenario/Base
Base	76,800	21,800	22,300	38,000	
1	122,000	26,100	26,700	57,100	1.5
2	109,900	23,500	26,700	51,300	1.3
3	105,400	22,300	26,700	49,300	1.3
4	98,700	21,200	25,000	46,200	1.2

Table B 5: 2051 forecast vehicle volumes of the State Highway network with a maximum upper limit

Scenario	SH1 north	Mill Road	SH2	SH1 south	Scenario/Base
Base	76,800	21,800	22,300	38,000	
1	120,200	25,700	26,700	53,300	1.4
2	108,300	23,200	26,700	48,100	1.3
3	103,900	22,000	26,700	46,300	1.3
4	97,400	21,000	25,000	43,400	1.2

It is important to note a significant limitation of this analysis (and hence why future studies should make use of the most up to date MSM model when it is available) as the congestion increases more people are likely to consider alternative modes whereas in this case it assumes everyone will continue driving despite the congestion. We also consider the total forecast population ratio is 51900/31900 ie 1.6 a reasonable verification in comparison to column 6 of Table B 4 and Table B 5.

Distribution assumptions

Following the peak hour counts factored into ADT, the estimated traffic volume forecasts presented in Table 6, Section 9.1 has been developed according to the following method

- Based on the land use adjustments, the trips have been factored up based on the respective population difference for each community and local employment trends have incorporated reduced non-local trips
- The proportions of communities using the state highway network increases as the distance travelled increases, for example trips from Hamilton to Auckland are likely to have a higher proportion of trips via SH1 whereas trips with smaller travelling distances may use alternative routes
- Trips originating and ending in rural areas have higher uncertainty and therefore use of alternative routes is expected
- This method has been validated by comparing base and forecast outputs of the WRTM to the trip distribution analysis of this study prior to factoring trips

It is acknowledged that the above process is very simplistic and not likely as accurate as a regional transportation model.

Scenario methodology

Several scenarios have been created to determine the likely mode shift based on strategic investment into public transportation and walking and cycling amenities.

Scenario 1 – anticipates the WRTM forecasts are representative with the adjusted land use forecasts

Scenario 2 – anticipates a 15% mode shift of north Waikato communities

Scenario 3 – anticipates a 25% mode shift of north Waikato communities

Scenario 4 – As Scenario 3, but with a 50% mode shift of freight onto rail.

The distances between most communities within the study area are too great to make significant travel by active modes attractive between townships. However, within communities that have high internal trips such as Tuakau, Pōkeno, and Te Kauwhata, appropriate investment into walking cycling paths internally is likely to encourage mode shift. However as these are internal trips they are not likely to reduce the reliance on the State Highway network substantially, without land use changes. Thus we have omitted including this potential mode shift from the analysis of the effect on the SH network.

Hence for the purpose of this study it is more beneficial to investigate the impact of investment into public transport as this mode is more related to reductions in vehicle trips that rely on the State Highway network. As identified in section 6.4, each community is within vicinity of the NIMT rail corridor. Bus

travel could be used to increase the catchment onto rail – this requires improvements to the existing bus network.

The above scenarios are essentially a low expectation of PT adoption, a realistic adoption, and a high adoption in comparison with the case study comparing the Wellington region network.

We have acknowledged Auckland as a trip end is a large region resulting in substantial variations in the likely take up of PT. Hence we have assumed a maximum of 10% adoption as a destination via rail.

Scenario 1 to 3 assume the forecast HCV composition remains constant to the forecast year whereas Scenario 4 has adopted a 50% mode shift onto rail as shown in Table B 6.

Table B 6: Existing HCV composition and forecast HCV composition following 10% mode shift onto rail

	Direction	HCV% existing	Mode shift factor	HCV% Scenario 4
1	NB	13%	0.5	11%
	SB	13%	0.5	11%
2	EB/WB	9%	0.5	8 %
3	EB/WB	12%	0.5	11%
4	NB	13%	0.5	11%
	SB	13%	0.5	11%

Validation

Validation of the methodology has included a comparison of the total new trips generated from the updated population forecasts, ie the total number of new trips does not exceed the 1.66 population factor difference identified in Section 3.3.

Future Development Plan 2023 #4944

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. **What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?**

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. **What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?**

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

See attached

SUBMISSION TO AUCKLAND COUNCIL ON THE DRAFT FUTURE DEVELOPMENT STRATEGY (FDS)

Name: Te Henga Family Trust (**Trust**) c/- R.H. Pickmere (**Trustee**)
Address: [redacted]
Email: [redacted]
Phone: [redacted]
Date: 30 June 2023

The Trust is the Owner of Future Urban Zoned land at [redacted]. I make the following submission in response to the invitation to comment on the FDS.

The Trust strongly opposes AC's approach and intentions in the FDS for a number of reasons, including:

1. The FDS is ultra vires any statutory authority in any empowering legislation which, if enacted in such failure, will entitle parties to seek redress against AC which may include injunctive rights, judicial review and recovery of costs and damages.

2. It is for AC to take its own legal advice (at more cost to the ratepayers) but some of the background as to what AC should be doing is covered in a number of legislative requirements.

3. There is a National Policy Statement on Urban Development (**NPS:UD**) which was a result of wide consultation which sets out a framework to ensure a well-functioning urban environment. The NPS:UD provides clear and direct objectives and policies to ensure cities are well functioning urban environments and have sufficient development capacity to allow growth up and out in locations that have good access to existing services public transport and networks. The Supreme Court has ruled that, in accordance with the requirements in the RMA, a Council is required to give effect to a National Policy Statement: The Court has ruled that "give effect" means "implement".

4. The Enabling House Supply and Other Matters Amendment Act 2021 (affecting the RMA) addressed the intensification streamlined planning process that promulgates a programme *"that aims to remove barriers to the supply of land to make room for cities to grow up and out"*. A key Government initiative to seek to address the huge undersupply of houses.

5. The Future Urban Zones (**FUZ**) were the result of the Unitary Plan (**UP**) for Auckland.

6. As we all know, the UP was broad based and the culmination of some 5 years' work including consultations, Hearings, Appeals to Environment Court and High Court – the adoption then ending in a staged operative process. A huge amount of work and cost was incurred by AC and parties, but the outcome at least gave a framework that Auckland could work with and giving a degree of certainty of what we wanted Auckland to look like in the future.

7. Considerable work went into how and what growth would look like and where.

8. This also identified FUZ which took into account urban boundaries to protect national productive soils, natural features, rural interface, hapu and iwi values and so on..

9. AC should review submissions made (including its own) to ensure the UP allowed for acceptable outcomes: they are extensive, detailed, and inclusive of a wide range of views.

10. Parties have acted in reliance of the UP and FUZ and made significant decisions in accordance with the same.

11. The FDS does a number of things that breach AC's statutory requirements.

12. This includes:

    - removal of some FUZs;

    - by refusing to allow development in FUZ until future dates which are so far out that it negates any ability to bring such land into availability and use for the prescribed purpose of urban use.

13. There is no statutory basis for the FDS to be used for such purposes which effectively, subverts to UP.

14. The matters which AC seems to advance are the same issues that were considered in the UP process: if AC wants to have a "second bite" at that outcome, the FDS process is not the place to do this and it should take advice as to what would be a permitted process and timeframes. Whatever the process is, AC is highly likely to fall foul of its NPS:UD obligations.

15. The UP took some 6 years to properly work its way through: the FD gives 4 weeks to fundamentally change the UP. In no sense can that be reasonable to allow for a proper planning process and give confidence in the same (a key platform of the RMA), let alone allow time to engage with any external consultants and incur substantial cost and to respond to any Submissions..

16. In terms of specifics, I note the suggestion to defer UD in Drury West. The reasons in the FDS paper are not sustainable or factually correct. We would suggest AC and its consultants have a look at what is actually happening in Drury that support planned urban growth and infrastructure. These include:

    - AC announcing the expansion of Drury to "the size of Napier" (its words) and allowing another 50,000 people.

    - Kiwi Development is putting in a "Sylvia Park" retail development at Drury.

    - NZ Rail is installing 3 Stations as part of the $2.39 billion of transport improvements in South Auckland. This investment is on the basis of an extra 120,000 people expected to live in the area with 40,000 new houses and 38,000 new jobs. Presumably AC worked with Government on such projections and agreed with them. Is AC now saying that basis is not accurate and, if so, will it tell KiwiRail? If not, where did AC anticipate such growth would go? Presumably in FUZ which AC is now deferring to the point of negating FUZ for their intended purpose in any foreseeable future to meet known imminent needs.

    - Drury West is certainly one that will be serviced by major transport networks with very little added capital required from AC: most of that has or will come from Government. This clearly meets one of the key UD requirements.

    - At huge cost, the electrification of Rail to Pukekohe is being completed (but just for the moment ignore the inconvenient fact that the Pukekohe Station will not be ready until 2025, so I am not sure how that is going to practically work for commuters).

    - Fisher & Paykel have announced and is proceeding with its development in Drury West which will spend another $450m in its 2024 financial year for a site that is proposed to hold 15,000 to 20,000 employees.

    - The demographics in Drury have changed: it cannot be described as "greenfields" in the sense of sweeping sveltes of grassland/rural agribusinesses. AC is aware of the continued urban large development from Drury to Pukekohe, including Auranga (Charles Ma), Drury South, Lomai Properties, Blackridge Road, Paerata, and so on. Some of those have been the subject of Private Plan Changes which are very robust processes where the developers have provided and funded much of the required infrastructure and complied with environmental requirements addressed the very aspects now raised in the FDS. AC have agreed with and consented to all of

those: some post Environment Court processes but that is all part of good planning processes. And yet now says its decisions in FUZ does not apply to anyone else. That is extraordinary.

17. The FDS states the preference is to focus any increased development *"within Auckland's existing urban area on achieving more quality, higher density and mixed use development"* (FDS wording). The arrogance and supposed logic of that is breath-taking and unsustainable:

- It should not be an "either/or" and it smacks of the Franklin area being somewhere in the hinterland and not really part of Auckland (ie contrary to what the Supercity is supposed to be achieving).

- At any level or criteria, the current urban Auckland environs cannot cope now on infrastructure issues without overloading it more (for example, ask for actual reports of wastewater discharge into harbours, which is appalling) or provide full details of the basis on which AC is relying to make such statement to give confidence (as part of a planning process) that such a decision is reasonably sustainable to only look to pursue such option and remove any "out" growth.

- The underlying premise for the FDS seems to be lack of capital and funds. That is not unique to AC and is relevant to all urban developments / cities in the world to become a quality place for us all. None of us is expecting "instant" available funding / capital but there are many funding structures for infrastructure assets that recognise longer term returns and addressing intergenerational spread. To simply "turn off the tap" for people that currently want to live, work and contribute to Auckland will have long term negative consequences.

18. At a time when Auckland and New Zealand needs clear guidance and support to be the best we can to build a sustainable future for everyone, the FDS is a very shallow and regressive step that will result in lack of confidence for all: including anyone seeking to invest and make Auckland their home.

Future Development Plan 2023 #4946

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Intensification historically has resulted in some very poor outcomes for Auckland, including recent loss of life , due to poor planning and lack of capacity. Proper cost benefit analysis is required to identify the true cost of intensification versus greenfields development in Auckland.

Greenfield development must be included in the proposal with emphasis on areas that have a plan to create sustainable communities, including infrastructure and employment opportunities and making allowance for current and future environmental effects i.e avoid flood plains.

I support the identification of the Silverdale West /Dairy Flat/Wainui areas being suitable for further investigation , but object to the timing deferral . These areas were initially meant to be "developer ready" by now, under the initial FULSS provisions.

I do not support devolving Auckland into a third world city due to poor planning for growth.

1. To date there has been a lot of consultation in Dairy Flat that has gone nowhere, at a cost of time and money.

2. The further intensification of already developed areas is going to put more pressure on existing infrastructure. Poor maintenance of current infrastructure has not coped with weather patterns, so how is additional intensification of housing/development going to be managed without overload ? Infrastructure needs to be improved to meet current loads before imposing more.

2. We would like to see planning of developments using the model of Hobsonville Point where there is a variety of housing and follows a big picture plan rather than continual botching..

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Firstly, I am objecting to the time frame set down for understanding, without any dialogue or public consultation by both Auckland Council and Auckland Transport on such an important matter. The FDS is proposed to replace the Future Urban Land Supply Strategy, which required extensive community wide consultation and modification to respond to the communities needs. The FDS is now railroading the process, on a completely different basis, completely ignoring any prior feedback or input.

Further time and supporting material for the Council and AT proposals needs to be provided including full community engagement.

I request that proper community engagement process is the first step i.e community meetings etc.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

I don't know

Tell us why

Pros: easy access to jobs & city-centre etc, parking?? less travel

Cons: areas may become too dense, a sense of disconnection and isolation may arise.
Interesting: the main city may have interesting implications in this scenario e.g. disconnection, redundance, extremely inconvenient (potentially) commute to city if needed. Dystopia??

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

All the reasons listed, I agree with.
Con: Isolation from other centres/ people in other areas.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
I totally agree, however I thinks it would still be important to monitor and investigate areas not showing signs of hazards, because of the unpredictability of nature.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why
Completely agree with this! But also sometimes hyper-modern architecture is sad (I know this is not your domain), but executing these functions in a semi-conservative architecture style would be amazing.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #4969

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

I don't know

Tell us why

We need to keep green spaces.

Is this possible when we are growing in existing urban areas?

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Other

Tell us why

It's hard to say - being able to access services is ideal in theory would lower the transport costs. What spaces are available for community services?

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Other

Tell us why

Strengthen and build or eliminating significant risk in these areas

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Other

Tell us why

Question is to broad
what prioritized please?

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

SUBMISSION

AUCKLAND COUNCIL FUTURE DEVELOPMENT STRATEGY JUNE 2023

My name is _____ and I am a resident of the Silverdale West /Dairy Flat/North Auckland area and am directly affected by the proposed changes outlined in the Future Development Strategy(FDS) as proposed.

Firstly, **I am objecting to the time frame set down for understanding, without any dialogue or public consultation by both Auckland Council and Auckland Transport on such an important matter contained within the FDS**. The FDS is proposed to replace the Future Urban Land Supply Strategy, which required extensive community wide consultation and modification to respond to the communities needs over a number of years. The FDS is now railroading the process, on a completely different basis, completely ignoring any prior feedback or input.

Further time and supporting material for the Council and AT proposals needs to be provided including full community engagement.

I request that proper community engagement process is the first step i.e community meetings etc.

Intensification historically has resulted in some very poor outcomes for Auckland, including recent loss of life , due to poor planning and lack of capacity. Proper cost benefit analysis is required to identify the true cost of intensification versus greenfields development in Auckland.

The **FULSS previously identified the Dairy Flat /Silverdale West area as the most cost effective land, with least major constraints, that is immediately accessible to SH1,** being bisected by the motorway, in the Auckland Region. Full cost benefit analysis will confirm that new infrastructure alongside the motorway will be cheaper in the long run than trying to expand existing infrastructure that is already at or over capacity, on existing zoned land.

Greenfield development must be included in the proposal accordingly, with emphasis on areas that have a plan to create sustainable communities, including infrastructure and employment opportunities and making allowance for current and future environmental effects i.e avoid flood plains.

I support the identification of the Silverdale West /Dairy Flat/Wainui areas being suitable for further investigation , but object to the timing deferral . These areas were initially meant to be "developer ready" by 2022, under the initial FULSS provisions.

I do not support devolving Auckland into a third world city due to poor planning for growth.

Dairy Flat

Future Development Plan 2023 #5031

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

People need space and opportunities to be outdoors amongst nature. Being part of a rural community supports our hauora. Intensification and dense housing contributes negatively on mental health and ultimately crime

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Unless workplaces/business development have zero impact on surrounding houses, land, water ways & produce no emissions from vehicles accessing & departing the business, they will negatively impact.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

But A.T's proposal to create a rapid transit network in areas that are a flooding hazard is ridiculous.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Once again consideration needs to be given to the impact of that infrastructure on the environment. For example, if a water park was created in a wetland area it would preserve the wetland area it would preserve the wetland aspect but impact the bird & plant life as increasing numbers of patrons accesses the facility.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Yes. See attached documents: "Submission. Auckland council Future Development Strategy June/July 2023"

SUBMISSION

AUCKLAND COUNCIL FUTURE DEVELOPMENT STRATEGY JUNE/JULY 2023

My name is [redacted] and I am a resident of the Silverdale West /Dairy Flat/North Auckland area and am directly affected by the proposed changes outlined in the Future Development Strategy (FDS) as proposed.

Firstly, I am objecting to the time frame set down for understanding, without any dialogue or public consultation by both Auckland Council and Auckland Transport (AT) on such an important matter. The FDS is proposed to replace the Future Urban Land Supply Strategy, which required extensive community wide consultation and modification to respond to the community's needs. The FDS is fast tracking the process, on a completely different basis than previous proposed, completely ignoring any prior community feedback or input.

Further, time and supporting material for the Council and AT proposals need to be provided including full community engagement.

I request that a proper community engagement process is the first step i.e community meetings, more details provided, 3D models showing proposed development and construction etc.

Intensification historically has resulted in some very poor outcomes for Auckland, including recent loss of life (flooding catastrophe), due to poor planning and lack of capacity within existing infrastructure. Proper cost benefit analysis is required to identify the true cost of intensification versus greenfield development in Auckland. One of the key drivers of the FDS is to protect existing wetlands and develop new wetlands in areas where these have previously been lost. It necessary to recognise that any industrial development in this community will increase emissions whether they be from vehicles travelling to and from the business, or directly emitted from the business into surrounding rural land that is home to bird species, livestock, domestic pets and wetlands.

Greenfield development must be included in the AT proposal with emphasis on areas that have a plan to create sustainable communities, including infrastructure and employment opportunities and making allowance for current and future environmental effects i.e avoid flood plains. It makes no sense for AT to propose a rapid transit corridor that traverses Dairy Stream Road where a significant stream dissects the road and frequently causes a flooding hazard. If the aim is for the Council and AT to choose sustainable methods of mobility such as walking and cycling in communities, then invest the high rates levies we already pay, and install footpaths, cycleways and street lights so that we can walk to existing bus stops.

Additionally, it needs to be stated that any growth and change must respect the existing communities. The FDS proposes building employment hubs to bring work closer to homes, how does this respect the rural aspect we have enjoyed living in for 30+ years? Surely this concept contradicts the Council's own acknowledgement that due to the Covid pandemic there have been significant behaviour changes in the workforce with greater numbers of people working from home.

I support the identification of the Silverdale West /Dairy Flat/Wainui areas being suitable for further investigation, but object to the timing deferral. These areas were initially meant to be "developer

ready" by now, under the initial FULSS provisions. For some landowners this would have meant subdividing larger acreage lots to provide additional housing while still maintaining the rural aspect of the community and accommodating future growth.

I do not support these identified areas of Auckland devolving into substandard intensification due to poor planning for growth, and a rush to make decisions without adequate analysis and input from affected parties. What may look fine in a drawing or 3D model doesn't take into consideration the impact on the lives of those of us who have lived in this community for 30+ years, and have invested our life savings into homes and lifestyles that provide for our hauora and overall quality of life.

Regards

[redacted]

Dairy Flat

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

AK council id already short of funding. So I prefer to keep the work within existing urban areas.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Save money & time from commute

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #5054

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Improve people's livelihood and quality.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Increase public infrastructure will make it more convenient for commuting and activities.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Reduce logging is a good choice.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Improving infrastructure to effectively responde to the harsh environment caused by the climate change.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Traffic, I think transport system is Auckland's priority for improvement.

Future Development Plan 2023 #5055

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Other

Tell us why

1. Geographical conditions and ecology should serve as the criteria for whether the development of the area should be an intensive development zone. 2. For example, dense residential areas can be developed near the existing factory areas and commercial centres, which is convenient for commuting and with public transportation systems. But need to know whether the factory area shows emissions and pollution hazard that will affect the residential area.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

1. Roads need sufficient space. Even if people use public transportation more, there still need to be wide roads. If an accident occurs, police cars, ambulances, fire trucks, etc. could have enough road space to pass by, and rubbish collecting trucks also need space to collect rubbish and avoid hindering the traffice behind. 2. More public tranport stations should be set up.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why
Environment and ecology, soil and drainage need to be considered first.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why
Biology and plants also need to be preserved in the natural environment. To green the environment.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

1. Traffic connection system, for example, when going from point A to point B in each district, the transfer points should be arranged so that it is convenient for people to become accustomed to using public transportation. 2. Establish more key districts in business districts, not only more entrepreneurs, but also increase employment opportunities. Build more small commercial retails to attract consumption. 3. Rubbish collection and sanitation should be improved so as not to cause indecent pollution.

Future Development Plan 2023 #5060

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Concentrate the resources and focus on priorities. Avoid development in wider areas. Development in grid styles. Start the development from current area and develop the whole region step by step.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

From spotted development to all-area development. Avoid insufficient development and sprawl.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

It is not too late

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

This is an important work for the harmony with nature and for the people.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

1. Vigorously develop urban public transportation in the central areas. Public transportation is the vein of the city. Only when the veins are unblocked can the city be fluid, resources be fully mobilised, and economic activities be more prosperous.

Future Development Plan 2023 #5071

1. It is necessary to improve the efficiency of government projects to save money. For example, if a project takes too long, it will increase expenditure and affect people's livelihood as well.

Future Development Plan 2023 #5077

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

I don't know

Tell us why

More dense and compact towns also means a denser population and a higher utilisation rate. How to arrange the population, diversion and improved planning should be the focus of development. Focusing on the development of existing urban areas for the sake of development is not the way to solve the problem. For example, following the natural disasters earlier this year, whether these affected places are suitable for living needs to be reconsidered. How the population of Auckland is going to increase, and how much the demand for environmental facilities will be, all of which need to be calculated and coordinated. The functions of current urban towns are not effective. It's the same almost like everywhere else.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

1. After this year's flood and cyclone, is it necessary for professionals to re-evaluate the liveability of flood-damaged houses? 2. When the population condenses in the centres, traffic congestion seems to be the number one issue. People usually drive cars to travel when they have something to do, because it saves time and money and can be used for shopping and storage. But what is the alternatives to a car?

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Strongly agree. Protect people safety. At the same time, there needs to have warning signs to prevent uninformed people from stepping into the dangerous range. Please pay special attention to flood discharge! When there are population increase and higer density, it is often necessary to clean up the debris at the drainage.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

The infrastructure needs to be able to effectively deal with climate change. But if these plans are slogans, they become empty words. Or, is the Council only uses these empty words as empty promises. It is meaningless on paper. The point is that, when can the construction of these facilities start? When there is sufficient money, if there is a lack of skilled construction personnel, will you be considering to bring in overseas workers? Or make people increase work on Saturdays?

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

In addition to urban planning, the future of Auckland is more reflected in the education of the next generation, the interaction between people, and the hope of life. Today there are many crimes and an increase in robbery and homicide cases. Is there any way to deal with these issues seriously? There are not enough Police Officers, the law is not effective, there is no law to follow. The economy is not good, and the poor are becoming even poorer. It is absolutely understandable that people may have no money, but simply stealing and robbing cannot solve the problem at all. Poverty may not only be caused by lack of money, but also because of drug addiction, or affacted by the Gangs. If the government does not amend the law, then how should we solve social problems? If social problems are not addressed, the next generation will most likely leave this place where they grew up. Isn't the talent that has been cultivated for many years lost in vain? Then the country goes to hire overseas workers, which is not good for the country. You don't love people, people don't love you! If you don't love the country, if the country doesn't prosper, you won't be any better!

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #5082

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Other

Tell us why

The city is so dense that it causes traffic jams. It is not conducive to development. It will be better if there is an even and reasonable distribution (of development)

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

This will only make the residential area more crowded, more densely populated, no privacy among residents, more cars parked on road side blocking traffics, and easier for thieves to steal. In the neighborhood where I live, ten years ago there were no cars parked on the road side and the streets were peace and quiet. Travel was very comfortable. Now that the population is increasing, there are many cars on both sides of the street. Every time passing by, we had to avoid cars, making travel inconvenient. Especially during the weekly rubbish collecting days, the rubbish bins placed on the road side are often blocked by cars parked there. As a result, the rubbish trucks can not take away my household rubbish. I d to take the smelly and heavy rubbish bin back to my house, praying that it would be colllected next week. It happened three times this year! it's very infuriating.

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Auckland's terrain is high and low with uphills and downhills. It is always very strenuous whether walking or cycling. Coupled with the underdeveloped and inconvenient public transport system, people still choose private cars for travelling. Focusing the development near the centres will only lead to more congestion, higher prices, and worse public security.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

It is necessary from the safety perspective.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

More surveillance cameras in neighborhoods and other places to provide evidence against increasing law and order issues, such as theft, shootings, etc.. We need to effectively combate and curb crimes.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #5233

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #5325

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Future Development Plan 2023 #5368

Note: this version of the feedback form has been created for the purpose of publishing submissions. As such, contact and demographic information has been removed and handwritten submissions have been transcribed.

Your feedback

Focusing growth

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Disagree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Disagree

Tell us why

It will exacerbate polarisation.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Disagree

Tell us why
More open prevention is needed at the occasion of environmental degradation.

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why
Infrastructure really needs to be improved.

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?

Denser, more compact cities result in improvements to the environment, the economy, and people's wellbeing.

Auckland's urban area is made up of neighbourhoods, town centres and business areas that are interconnected and that support where most Aucklanders live, work and spend their leisure time.

We propose that most housing and business growth will be focused within existing urban areas and that this growth be more intensive. This means less growth in greenfield areas at Auckland's edges. What greenfield growth there is will be phased over 30 years and longer.

1. What do you think of our approach to focus most of Auckland's growth in existing urban areas?

Agree

Tell us why

Accessible local centres

When people have easy access to workplaces, services, facilities and shops, communities become more resilient and connected. It also helps to reduce travel time, emissions and lower household transport costs.

We propose focusing housing and business development near local centres where most people's daily needs are easy to access by walking, cycling and public transport.

2. What do you think of our approach to focus development near local centres?

Agree

Tell us why

At the edge of Auckland, there are still a lot of land needs to be developed. The development of surrounding areas can disperse the population of Auckland to different places, reducing the need to concentrate in the city center. As long as the Council can speed up the development of roads, developmore greenlands will distribute resources to support facilities in various towns.

Avoiding hazards

As our climate changes, the frequency and severity of hazards such as flooding, sea-level rise and coastal erosion will worsen. Where and how we plan for growth, and how we adapt to these hazards is increasingly important.

We propose that known areas constrained by significant natural hazard risk should be looked at to see if further development is appropriate.

Where development is already enabled in potentially vulnerable locations, we will further investigate appropriate actions.

3. What do you think of our approach to avoid further growth in areas which are exposed to significant risk of environmental hazards?

Agree

Tell us why

Resilient infrastructure

Infrastructure across Auckland needs to cope with ongoing change, such as the impacts of climate change and evolving technology.

Nature-based infrastructure, such as rain gardens, swales, and detention basins, is better able to respond to ongoing change. This can help protect communities from hazards, as well as protect and restore the natural environment.

We propose prioritising investment in infrastructure that is decentralised, nature-based, regenerative and mauri-enhancing.

4. What do you think of our approach to prioritising nature-based infrastructure that responds to the impacts of climate change?

Agree

Tell us why

Other feedback

5. Do you have any other feedback on our approach to how and where Auckland should grow and change?
